b-QUARK MASS

The b -quark mass is estimated from bottomonium and B masses. It corresponds to the “running” mass m_b ($\mu = m_b$) in the $\overline{\text{MS}}$ scheme. We have converted masses in other schemes to the $\overline{\text{MS}}$ scheme using two-loop QCD perturbation theory with $\alpha_s(\mu=m_b) = 0.22$. The range 4.0–4.5 GeV for the $\overline{\text{MS}}$ mass corresponds to 4.6–5.1 GeV for the pole mass (see the “Note on Quark Masses”).

¹ ABBIENDI 01S find $m_b(M_Z)$ to be 2.67 ± 0.4 GeV from an analysis of $Z \rightarrow b$ decays.

² KUHN 01 uses an analysis of the e^+e^- total cross section to hadrons.

³ NARISON 01B uses pseudoscalar sum rules in the B and D meson channels.

⁴ BARATE 00V obtain the b quark mass $m_b(M_Z) = 3.27 \pm 0.22(\text{stat}) \pm 0.22(\text{exp}) \pm 0.38(\text{had}) \pm 0.16(\text{thy})$ from an analysis of event shape variables in Z decays. We have converted this to $\mu=m_b$.

⁵ HOANG 00 uses a NNLO calculation of the vacuum polarization function to determine spectral moments of the masses and electronic decay widths of the Υ mesons.

⁶ LUCHA 00, PINEDA 00 obtain the b -quark mass from a perturbative calculation of the Υ spectrum and decay widths to order α_s^4 .

⁷ BENEKE 99 uses a calculation of the $b\bar{b}$ production cross section and the mass of the Υ meson at NNLO.

⁸ BRANDENBURG 99 obtain a b -quark mass of $m_b(M_Z) = 2.56 \pm 0.27^{+0.28+0.49}_{-0.38-1.48}$ from a study of three-jet events at the Z . We have converted this to $\mu=m_b$.

- ⁹ HOANG 99 uses a NNLO calculation of the vacuum polarization function to determine spectral moments of the masses and electronic decay widths of the Υ mesons.
- ¹⁰ MELNIKOV 99 compute the quark mass using Υ sum rules at NNLO.
- ¹¹ PENIN 99 compute the quark mass using Υ sum rules at NNLO.
- ¹² ABREU 98i determines the \overline{MS} mass $m_b = 2.67 \pm 0.25 \pm 0.34 \pm 0.27$ GeV at $\mu=M_Z$ from three jet heavy quark production at LEP. ABREU 98i have rescaled the result to $\mu = m_b$ using $\alpha_s=0.118 \pm 0.003$.
- ¹³ KUEHN 98 uses a calculation of the vacuum polarization function, including resumming threshold effects, to determine spectral moments of the masses of the Υ mesons. We have converted their extracted value of 4.75 ± 0.04 for the pole mass to the \overline{MS} scheme.
- ¹⁴ GIMENEZ 97 uses lattice computations of the B -meson propagator and the B -meson binding energy $\bar{\Lambda}$ in the HQET. Their systematic (second) error for the \overline{MS} mass is an estimate of the effects of higher-order corrections in the matching of the HQET operators (renormalon effects).
- ¹⁵ JAMIN 97 apply the QCD moment method to the Υ system. They also find a pole mass of 4.60 ± 0.02 .
- ¹⁶ RODRIGO 97 determines the \overline{MS} mass $m_b = 2.85 \pm 0.22 \pm 0.20 \pm 0.36$ GeV at $\mu=M_Z$ from three jet heavy quark production at LEP. We have rescaled the result.
