

$$I(J^P) = 0(\frac{1}{2}^+) \text{ Status: } ***$$

In the quark model, a Λ_b^0 is an isospin-0 udb state. The lowest Λ_b^0 ought to have $J^P = 1/2^+$. None of I , J , or P have actually been measured.

Λ_b^0 MASS

5650 ⁺¹⁵⁰ ₋₂₀₀	90	BARI	91 SFM	$\Lambda_b^0 \rightarrow \Lambda_c^+ \pi^+ \pi^- \pi^-$

¹ ABE 97B observed 38 events above a background 18 ± 1.6 events in the mass range 5.60–5.65 GeV/ c^2 , a significance of > 3.4 standard deviations.

² Uses 4 fully reconstructed Λ_b events.

³ ABE 93B states that, based on the signal claimed by ALBAJAR 91E, CDF should have found $30 \pm 23 \Lambda_b^0 \rightarrow J/\psi(1S)\Lambda$ events. Instead, CDF found not more than 2 events.

⁴ ALBAJAR 91E claims 16 ± 5 events above a background of 9 ± 1 events, a significance of about 5 standard deviations.

Λ_b^0 mass (MeV)

Λ_b^0 MEAN LIFE

These are actually measurements of the average lifetime of weakly decaying b baryons weighted by generally unknown production rates, branching fractions, and detection efficiencies. Presumably, the mix is mainly Λ_b^0 , with some Ξ_b^0 and Ξ_b^- .

See b -baryon Admixture section for data on b -baryon mean life average over species of b -baryon particles.

“OUR EVALUATION” is an average of the data listed below performed by the LEP B Lifetimes Working Group as described in our review “Production and Decay of b -flavored Hadrons” in the B^\pm Section of the Listings. The averaging procedure takes into account correlations between the measurements and asymmetric lifetime errors.

⁵ Measured using $\Lambda_c \ell^-$ and $\Lambda \ell^+ \ell^-$.

Λ_b^0 DECAY MODES

These branching fractions are actually an average over weakly decaying b -baryons weighted by their production rates in Z decay (or high-energy $p\bar{p}$), branching ratios, and detection efficiencies. They scale with the LEP Λ_b production fraction $B(b \rightarrow \Lambda_b)$ and are evaluated for our value $B(b \rightarrow \Lambda_b) = (10.1^{+3.9}_{-3.1})\%$.

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{ anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow \Lambda_b)$ were used to determine $B(b \rightarrow \Lambda_b)$, as described in the note "Production and Decay of b -Flavored Hadrons."

Mode	Fraction (Γ_i/Γ)	Confidence level
Γ_1 $J/\psi(1S)\Lambda$	$(4.7 \pm 2.8) \times 10^{-4}$	
Γ_2 $pD^0\pi^-$		
Γ_3 $\Lambda_c^+\pi^-$	seen	
Γ_4 $\Lambda_c^+ a_1(1260)^-$	seen	
Γ_5 $\Lambda_c^+\pi^+\pi^-\pi^-$		
Γ_6 $\Lambda K^0 2\pi^+ 2\pi^-$		
Γ_7 $\Lambda_c^+ \ell^- \bar{\nu}_\ell \text{ anything}$	[a] $(9.0^{+3.1}_{-3.8})\%$	
Γ_8 $p\pi^-$	$< 5.0 \times 10^{-5}$	90%
Γ_9 pK^-	$< 5.0 \times 10^{-5}$	90%

[a] Not a pure measurement. See note at head of Λ_b^0 Decay Modes.

 Γ_7/Γ

The values and averages in this section serve only to show what values result if one assumes our $B(b \rightarrow \Lambda_b)$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(b \rightarrow \Lambda_b)$ as described in the note on "Production and Decay of *b*-Flavored Hadrons."
