

Table 4.1. Revised 1997 by C.G. Wohl (LBNL). The atomic number (top left) is the number of protons in the nucleus. The atomic mass (bottom) is weighted by isotopic abundances in the Earth's surface. Atomic masses are relative to the mass of the carbon-12 isotope, defined to be exactly 12 unified atomic mass units (u). Errors range from 1 to 9 in the last digit quoted. Relative isotopic abundances often vary considerably, both in natural and commercial samples. A number in parentheses is the mass of the longest-lived isotope of that element—no stable isotope exists. However, although Th, Pa, and U have no stable isotopes, they do have characteristic terrestrial compositions, and meaningful weighted masses can be given. For elements 110–112, the atomic numbers of known isotopes are given. Adapted from the Commission of Atomic Weights and Isotopic Abundances, "Atomic Weights of the Elements 1995," *Pure and Applied Chemistry* **68**, 2339 (1996), and G. Audi and A.H. Wapstra, "The 1993 Mass Evaluation," *Nucl. Phys.* **A565**, 1 (1993). The names given below for elements 104 to 109 are those recommended by the International Union of Pure and Applied Chemistry in late 1997.
