

$$I(J^P) = 0(\frac{1}{2}^+) \text{ Status: } ****$$

The parity of the  $\Lambda_c^+$  is defined to be positive (as are the parities of the proton, neutron, and  $\Lambda$ ). The spin  $J$  has not actually been measured yet. Results of an analysis of  $pK^-\pi^+$  decays (JEZABEK 92) are consistent with the expected  $J = 1/2$ . The quark content is  $udc$ .

We have omitted some results that have been superseded by later experiments. The omitted results may be found in earlier editions.

### $\Lambda_c^+$ MASS

Measurements with an error greater than 5 MeV or that are otherwise obsolete have been omitted.

The fit also includes  $\Sigma_c - \Lambda_c^+$  and  $\Lambda_c^{*+} - \Lambda_c^+$  mass-difference measurements.

## $\Lambda_c^+$ DECAY MODES

Nearly all branching fractions of the  $\Lambda_c^+$  are measured relative to the  $pK^-\pi^+$  mode, but there are no model-independent measurements of this branching fraction. We explain how we arrive at our value of  $B(\Lambda_c^+ \rightarrow pK^-\pi^+)$  in a Note at the beginning of the branching-ratio measurements, below. When this branching fraction is eventually well determined, all the other branching fractions will slide up or down proportionally as the true value differs from the value we use here.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
<b>Hadronic modes with a <math>p</math> and one <math>\bar{K}</math></b>

## $\Lambda_c^+$ BRANCHING FRACTIONS

Revised 2000 by P.R. Burchat (Stanford University).

Most  $\Lambda_c^+$  branching fractions are measured relative to the decay mode  $\Lambda_c^+ \rightarrow pK^-\pi^+$ . However, there are no model-independent measurements of the absolute branching fraction for  $\Lambda_c^+ \rightarrow pK^-\pi^+$ . Here we describe the measurements that have been used to extract  $B(\Lambda_c^+ \rightarrow pK^-\pi^+)$ , the model-dependence of the results, and the method we have used to average the results.

ARGUS (ALBRECHT 88C) and CLEO (CRAWFORD 92) measure  $B(\bar{B} \rightarrow \Lambda_c^+ X) \times B(\Lambda_c^+ \rightarrow pK^-\pi^+)$  to be  $(0.30 \pm 0.12 \pm 0.06)\%$  and  $(0.273 \pm 0.051 \pm 0.039)\%$ . Under the assumptions that decays of  $\bar{B}$  mesons to baryons are dominated by  $\bar{B} \rightarrow \Lambda_c^+ X$  and that  $\Lambda_c^+ X$  final states other than  $\Lambda_c^+ \bar{N} X$  can be neglected, they also measure  $B(\bar{B} \rightarrow \Lambda_c^+ X)$  to be  $(6.8 \pm 0.5 \pm 0.3)\%$  (ALBRECHT 92O) and  $(6.4 \pm 0.8 \pm 0.8)\%$  (CRAWFORD 92). Combining these results, we get  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (4.14 \pm 0.91)\%$ . However, the assumption that  $\bar{B}$  decay modes to baryons other than  $\Lambda_c^+ \bar{N} X$  are negligible is not on solid ground experimentally or theoretically [1]. Therefore, the branching fraction for  $\Lambda_c^+ \rightarrow pK^-\pi^+$  given above may be low by some undetermined amount.

The second type of model-dependent determination of  $B(\Lambda_c^+ \rightarrow pK^-\pi^+)$  is based on measurements by ARGUS (ALBRECHT 91G) and CLEO (BERGFELD 94) of  $\sigma(e^+e^- \rightarrow \Lambda_c^+ X) \cdot B(\Lambda_c^+ \rightarrow \Lambda \ell^+ \nu_\ell) = (4.15 \pm 1.03 \pm 1.18)$  pb and  $(4.77 \pm 0.25 \pm 0.66)$  pb. ARGUS (ALBRECHT 96E) and CLEO (AVERY 91) have also measured  $\sigma(e^+e^- \rightarrow \Lambda_c^+ X) \cdot B(\Lambda_c^+ \rightarrow pK^-\pi^+)$ . The weighted average is  $(11.2 \pm 1.3)$  pb.

From these measurements, we extract  $R \equiv B(\Lambda_c^+ \rightarrow pK^-\pi^+)/B(\Lambda_c^+ \rightarrow \Lambda\ell^+\nu_\ell) = 2.40 \pm 0.43$ . We estimate the  $\Lambda_c^+ \rightarrow pK^-\pi^+$  branching fraction from the equation

$$B(\Lambda_c^+ \rightarrow pK^-\pi^+) = R f F \frac{\Gamma(D \rightarrow X\ell^+\nu_\ell)}{1 + |V_{cd}/V_{cs}|^2} \cdot \tau(\Lambda_c^+) , \quad (1)$$

where  $f = B(\Lambda_c^+ \rightarrow \Lambda\ell^+\nu_\ell)/B(\Lambda_c^+ \rightarrow X_s\ell^+\nu_\ell)$  and  $F = \Gamma(\Lambda_c^+ \rightarrow X_s\ell^+\nu_\ell)/\Gamma(D^0 \rightarrow X_s\ell^+\nu_\ell)$ . When we use  $1 + |V_{cd}/V_{cs}|^2 = 1.05$  and the world averages  $\Gamma(D \rightarrow X\ell^+\nu_\ell) = (0.163 \pm 0.006) \times 10^{-12} \text{ s}^{-1}$  and  $\tau(\Lambda_c^+) = (0.206 \pm 0.012) \times 10^{-12} \text{ s}$ , we calculate  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (7.7 \pm 1.5)\% \cdot f F$ . Theoretical estimates for  $f$  and  $F$  are near 1.0 with significant uncertainties.

So, we have two results with significant model-dependence:  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (4.14 \pm 0.91)\%$  from  $\overline{B}$  decays, and  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (7.7 \pm 1.5)\% \cdot f F$  from semileptonic  $\Lambda_c^+$  decays. If we set  $f F = 1.0$  in the second result, and assign an uncertainty of 30% to each result to account for the unknown model-dependence, we get the consistent results  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (4.14 \pm 0.91 \pm 1.24)\%$  and  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (7.7 \pm 1.5 \pm 2.3)\%$ . The weighted average of these two results is  $B(\Lambda_c^+ \rightarrow pK^-\pi^+) = (5.0 \pm 1.3)\%$ , where the uncertainty contains both the experimental uncertainty and the 30% estimate of model dependence in each result.

This procedure is clearly rather arbitrary, but so is any other procedure until good measurements of the absolute branching fraction are made. Therefore, we have assigned the value  $(5.0 \pm 1.3)\%$  to the  $\Lambda_c^+ \rightarrow pK^-\pi^+$  branching fraction (given as PDG 00 below). As was noted earlier, most of the other modes are measured relative to this mode.

New methods for measuring the  $\Lambda_c^+$  absolute branching fractions have been proposed [1,2].
