¹PERUZZI 77 and SCHINDLER 81 errors do not include the 0.13% uncertainty in the absolute SPEAR energy calibration. TRILLING 81 uses the high precision $J/\psi(1S)$ and $\psi(2S)$ measurements of ZHOLENTZ 80 to determine this uncertainty and combines the PERUZZI 77 and SCHINDLER 81 results to obtain the value quoted. TRILLING 81 enters the fit in the D^\pm mass, and PERUZZI 77 and SCHINDLER 81 enter in the $m_{D^\pm} - m_{D^0}$, below.

²Error does not include possible systematic mass scale shift, estimated to be less than 5 MeV.

$m_{D^\pm} - m_{D^0}$

The fit includes D^\pm , D^0 , D_s^\pm , $D^{*\pm}$, D^{*0} , and $D_s^{*\pm}$ mass and mass difference measurements.

A REVIEW GOES HERE – Check our WWW List of Reviews

$$|m_{D_1^0} - m_{D_2^0}|$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on “ D^0 - \bar{D}^0 Mixing,” above.

<u>VALUE ($10^{10} \hbar s^{-1}$)</u>	<u>CL%</u>	<u>DOCUMENT ID</u>	<u>TECN</u>	<u>COMMENT</u>
< 7	95	⁵ GODANG	00 CLE2	$e^+ e^-$
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
<32	90	^{6,7} AITALA	98 E791	π^- nucleus, 500 GeV
<24	90	⁸ AITALA	96C E791	π^- nucleus, 500 GeV
<21	90	^{7,9} ANJOS	88C E691	Photoproduction

⁵ This GODANG 00 limit is inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^-)$ (via \bar{D}^0)/ $\Gamma(K^- \pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.

⁶ AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows CP violation in this term, but assumes that $A_D = A_R = 0$. See the note on “ D^0 - \bar{D}^0 Mixing,” above.

⁷ This limit is inferred from R_M for $f = K^+ \pi^-$ and $f = K^+ \pi^- \pi^+ \pi^-$. See the note on “ D^0 - \bar{D}^0 Mixing,” above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from D^0 - \bar{D}^0 mixing.

⁸ This limit is inferred from R_M for $f = K^+ \ell^- \bar{\nu}_\ell$. See the note on “ D^0 - \bar{D}^0 Mixing,” above.

⁹ ANJOS 88C assumes that $y = 0$. See the note on “ D^0 - \bar{D}^0 Mixing,” above. Without this assumption, the limit degrades by about a factor of two.

$$(\Gamma_{D_1^0} - \Gamma_{D_2^0})/\Gamma = 2y$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on “ D^0 - \bar{D}^0 Mixing,” above.

$ \Delta\Gamma /\Gamma < 0.17$	90	^{14,16}	ANJOS	88C E691	Photoproduction

¹⁰ LINK 00, AITALA 99E, and ABE 02I measure the lifetime difference between $D^0 \rightarrow K^- K^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.

¹¹ CSORNA 02 measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $\pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.

¹² This GODANG 00 limit is inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^- \text{ (via } \bar{D}^0)) / \Gamma(K^- \pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. This is a measurement of y' and is not the same as the y_{CP} of LINK 00.

¹³ AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows CP violation in this term, but assumes that $A_D = A_R = 0$. See the note on “ D^0 - \bar{D}^0 Mixing,” above.

¹⁴ This limit is inferred from R_M for $f = K^+ \pi^-$ and $f = K^+ \pi^- \pi^+ \pi^-$. See the note on “ D^0 - \bar{D}^0 Mixing,” above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from D^0 - \bar{D}^0 mixing.

¹⁵ This limit is inferred from R_M for $f = K^+ \ell^- \bar{\nu}_\ell$. See the note on “ D^0 - \bar{D}^0 Mixing,” above.

¹⁶ ANJOS 88C assumes that $y = 0$. See the note on “ D^0 - \bar{D}^0 Mixing,” above. Without this assumption, the limit degrades by about a factor of two.

$$(\Gamma_1 - \Gamma_2)/\Gamma = 2y$$

D^0 DECAY MODES

Γ_{217} A dummy mode used by the fit. $(10.7 \pm 3.4) \%$ S=1.1

- [a] The exclusive e^+ modes $K^- e^+ \nu_e$, $K^- \pi^0 e^+ \nu_e$, $\overline{K}^0 \pi^- e^+ \nu_e$ and $\pi^- e^+ \nu_e$ are constrained to equal this (well-measured) inclusive fraction.
- [b] This is a weighted average of D^\pm (44%) and D^0 (56%) branching fractions. See " D^+ and $D^0 \rightarrow (\eta \text{ anything}) / (\text{total } D^+ \text{ and } D^0)$ " under " D^+ Branching Ratios" in these Particle Listings.
- [c] This value averages the e^+ and μ^+ branching fractions, after making a small phase-space adjustment to the μ^+ fraction to be able to use it as an e^+ fraction; hence our ℓ^+ here is really an e^+ .
- [d] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.
- [e] The two experiments measuring this fraction are in serious disagreement. See the Particle Listings.
- [f] The experiments on the division of this charge mode amongst its submodes disagree, and the submode branching fractions here add up to considerably more than the charged-mode fraction.
- [g] However, these upper limits are in serious disagreement with values obtained in another experiment.
- [h] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.
- [i] The value is for the sum of the charge states or particle/antiparticle states indicated.

CONSTRAINED FIT INFORMATION

An overall fit to 59 branching ratios uses 131 measurements and 1 constraint to determine 33 parameters. The overall fit has a $\chi^2=63.3$ for 99° of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to 1.

²⁰ BAI 00C finds the average (ϕ anything) branching fraction for the 4.03-GeV mix of D^+ and D^0 mesons to be $(1.34 \pm 0.52 \pm 0.12)\%$.

————— Semileptonic modes —————

$\Gamma(K^- \ell^+ \nu_\ell)/\Gamma_{\text{total}}$ Γ_8/Γ

We average our $K^- e^+ \nu_e$ and $K^- \mu^+ \nu_\mu$ branching fractions, after multiplying the latter by a phase-space factor of 1.03 to be able to use it with the $K^- e^+ \nu_e$ fraction. Hence our ℓ^+ here is really an e^+ .

0.043 ± 0.010	130	⁴⁰ PERUZZI	77 MRK1	e^+e^- 3.77 GeV

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.0381 ± 0.0015 ± 0.0016	1165	⁴¹ ARTUSO	98 CLE2	e^+e^- at $\Upsilon(4S)$
0.0369 ± 0.0011 ± 0.0016		⁴² COAN	98 CLE2	
0.0391 ± 0.0008 ± 0.0017	4208	^{37,43} AKERIB	93 CLE2	$e^+e^- \approx \Upsilon(4S)$

³⁶ This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.

³⁷ ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94F, and BARATE 97C use $D^*(2010)^+ \rightarrow D^0\pi^+$ decays. The π^+ is both slow and of low p_T with respect to the event thrust axis or nearest jet ($\approx D^{*+}$ direction). The excess number of such π^+ 's over background gives the number of $D^*(2010)^+ \rightarrow D^0\pi^+$ events, and the fraction with $D^0 \rightarrow K^-\pi^+$ gives the $D^0 \rightarrow K^-\pi^+$ branching fraction.

³⁸ ALBRECHT 94 uses D^0 mesons from $\overline{B}^0 \rightarrow D^{*+}\ell^-\overline{\nu}_\ell$ decays. This is a different set of events than used by ALBRECHT 94F.

³⁹ SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.24 ± 0.02 nb. We use the MARK-3 (ADLER 88C) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

⁴⁰ PERUZZI 77 (MARK-1) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.25 ± 0.05 nb. We use the MARK-3 (ADLER 88C) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

⁴¹ ARTUSO 98, following ALBRECHT 94, uses D^0 mesons from $\overline{B}^0 \rightarrow D^*(2010)^+X\ell^-\overline{\nu}_\ell$ decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.

⁴² COAN 98 assumes that $\Gamma(B \rightarrow \overline{D}X\ell^+\nu)/\Gamma(B \rightarrow X\ell^+\nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$, the last term accounting for $\overline{B} \rightarrow D_s^+KX\ell^-\overline{\nu}$. COAN 98 is included in the CLEO average in ARTUSO 98.

⁴³ This AKERIB 93 value does not include radiative corrections; with them, the value is $0.0395 \pm 0.0008 \pm 0.0017$. AKERIB 93 is included in the CLEO average in ARTUSO 98.

$\Gamma(K^+ \ell^- \bar{\nu}_\ell \text{ (via } \bar{D}^0)) / \Gamma(K^- \ell^+ \nu_\ell)$ Γ_{165} / Γ_8

This is a limit on R_M without the complications of possible doubly-Cabibbo-suppressed decays that occur when using hadronic modes. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2) / \Gamma$ that come from the best mixing limit, see near the beginning of these D^0 Listings.

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
<0.005	90	⁸⁸ AITALA	96C E791	π^- nucleus, 500 GeV

⁸⁸AITALA 96C uses $D^{*+} \rightarrow D^0 \pi^+$ (and charge conjugate) decays to identify the charm at production and $D^0 \rightarrow K^- \ell^+ \nu_\ell$ (and charge conjugate) decays to identify the charm at decay.

$\Gamma(K^+ \pi^-) / \Gamma(K^- \pi^+)$ $\Gamma_{166} / \Gamma_{20}$

This is R_b in the note on “ D^0 - \bar{D}^0 Mixing,” near the start of the D^0 Listings. The experiments here use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born. The $D^0 \rightarrow K^+ \pi^-$ decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by $D^0 \rightarrow \bar{D}^0$ mixing followed by $\bar{D}^0 \rightarrow K^+ \pi^-$ decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio; in the next data block we give the limits on the mixing ratio.

Some early limits have been omitted from this Listing; see our 1998 edition (EPJ **C3** 1).

⁸⁹This LINK 01 result assumes no D^0 - \bar{D}^0 mixing; see Fig. 4 of the paper for the DCS value as a function of the (unknown) mixing parameters x' and y' .

⁹⁰This GODANG 00 result assumes no D^0 - \bar{D}^0 mixing ($R_M=0$ in the note on “ D^0 - \bar{D}^0 Mixing” near the start of the D^0 Listings). The DCS ratio becomes $0.0048 \pm 0.0012 \pm 0.0004$ when mixing is allowed.

⁹¹This AITALA 98 result assumes no D^0 - \bar{D}^0 mixing ($R_M=0$ in the note on “ D^0 - \bar{D}^0 Mixing” near the start of the D^0 Listings). The DCS ratio becomes $0.0090^{+0.0120}_{-0.0109} \pm 0.0044$ when mixing is allowed.

⁹² BARATE 98W gets $0.0177^{+0.0060}_{-0.0056} \pm 0.0031$ for the DCS ratio when mixing is allowed, assuming no interference between the DCS and mixing amplitudes ($y' = 0$ in the note on “ D^0 - \bar{D}^0 Mixing” near the start of the D^0 Listings).

⁹³ CINABRO 94, AMMAR 91, and ALBRECHT 87K cannot distinguish between doubly Cabibbo-suppressed decay and D^0 - \bar{D}^0 mixing.

⁹⁴ ANJOS 88C allows mixing but assumes no interference between the DCS and mixing amplitudes ($y' = 0$ in the note on “ D^0 - \bar{D}^0 Mixing” near the start of the D^0 Listings). When interference is allowed, the limit degrades to 0.049.

$\Gamma(K^+ \pi^- \text{ (via } \bar{D}^0)) / \Gamma(K^- \pi^+)$

$\Gamma_{167} / \Gamma_{20}$

This is R_M in the note on “ D^0 - \bar{D}^0 Mixing” near the start of the D^0 Listings. The experiments here (1) use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born; and (2) use the decay-time distribution to disentangle doubly Cabibbo-suppressed decay and mixing. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2) / \Gamma$ that come from the best mixing limit, see near the beginning of these D^0 Listings.

D^0 PRODUCTION CROSS SECTION AT $\psi(3770)$

A compilation of the cross sections for the direct production of D^0 mesons at or near the $\psi(3770)$ peak in e^+e^- production.

<u>VALUE (nanobarns)</u>	<u>DOCUMENT ID</u>	<u>TECN</u>	<u>COMMENT</u>
• • • We do not use the following data for averages, fits, limits, etc. • • •			
5.8 ± 0.5 ± 0.6	123 ADLER	88C MRK3	e^+e^- 3.768 GeV
7.3 ± 1.3	124 PARTRIDGE	84 CBAL	e^+e^- 3.771 GeV
8.00 ± 0.95 ± 1.21	125 SCHINDLER	80 MRK2	e^+e^- 3.771 GeV
11.5 ± 2.5	126 PERUZZI	77 MRK1	e^+e^- 3.774 GeV
123	This measurement compares events with one detected D to those with two detected D mesons, to determine the the absolute cross section. ADLER 88C find the ratio of cross sections (neutral to charged) to be $1.36 \pm 0.23 \pm 0.14$.		
124	This measurement comes from a scan of the $\psi(3770)$ resonance and a fit to the cross section. PARTRIDGE 84 measures 6.4 ± 1.15 nb for the cross section. We take the phase space division of neutral and charged D mesons in $\psi(3770)$ decay to be 1.33, and we assume that the $\psi(3770)$ is an isosinglet to evaluate the cross sections. The noncharm decays (e.g. radiative) of the $\psi(3770)$ are included in this measurement and may amount to a few percent correction.		
125	This measurement comes from a scan of the $\psi(3770)$ resonance and a fit to the cross section. SCHINDLER 80 assume the phase space division of neutral and charged D mesons in $\psi(3770)$ decay to be 1.33, and that the $\psi(3770)$ is an isosinglet. The noncharm decays (e.g. radiative) of the $\psi(3770)$ are included in this measurement and may amount to a few percent correction.		
126	This measurement comes from a scan of the $\psi(3770)$ resonance and a fit to the cross section. The phase space division of neutral and charged D mesons in $\psi(3770)$ decay is taken to be 1.33, and $\psi(3770)$ is assumed to be an isosinglet. The noncharm decays (e.g. radiative) of the $\psi(3770)$ are included in this measurement and may amount to a few percent correction. We exclude this measurement from the average because of uncertainties in the contamination from τ lepton pairs. Also see RAPIDIS 77.
