

$$I(J^P) = 0(0^-)$$

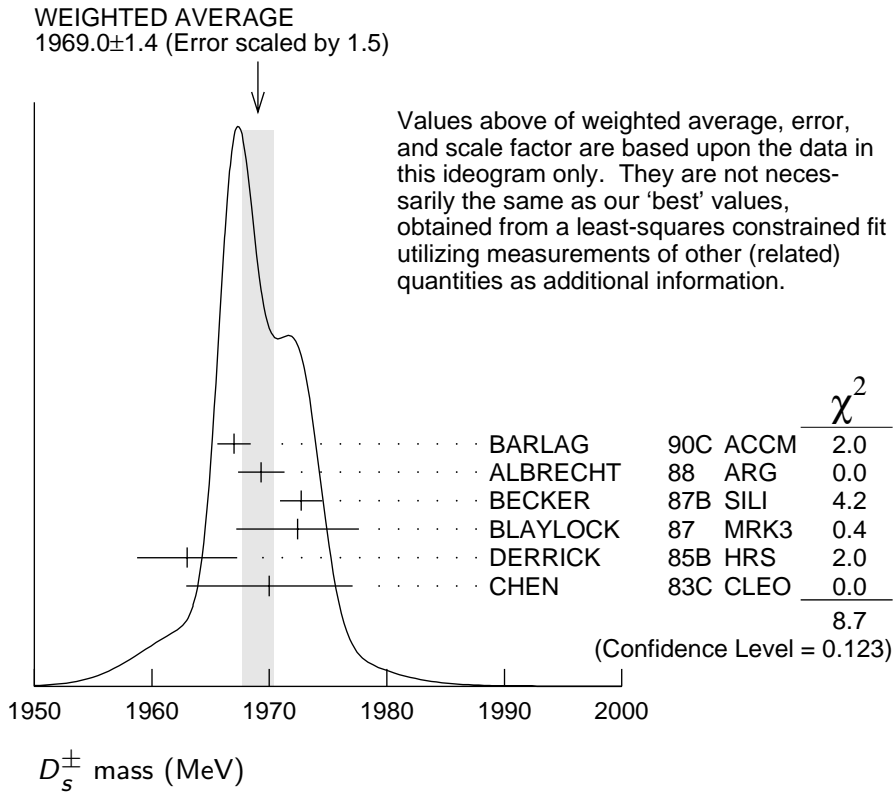

The angular distributions of the decays of the  $\phi$  and  $\bar{K}^*(892)^0$  in the  $\phi\pi^+$  and  $K^+\bar{K}^*(892)^0$  modes strongly indicate that the spin is zero. The parity given is that expected of a  $c\bar{s}$  ground state.

### $D_s^\pm$ MASS

The fit includes  $D^\pm$ ,  $D^0$ ,  $D_s^\pm$ ,  $D^{*\pm}$ ,  $D^{*0}$ , and  $D_s^{*\pm}$  mass and mass difference measurements. Measurements of the  $D_s^\pm$  mass with an error greater than 10 MeV are omitted from the fit and average. A number of early measurements have been omitted altogether.

- [a] For now, we average together measurements of the  $X e^+ \nu_e$  and  $X \mu^+ \nu_\mu$  branching fractions. This is the *average*, not the *sum*.
- [b] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.
- [c] This branching fraction includes all the decay modes of the final-state resonance.
- [d] This value includes only  $K^+ K^-$  decays of the intermediate resonance, because branching fractions of this resonance are not known.
- [e] This value includes only  $\pi^+ \pi^-$  decays of the intermediate resonance, because branching fractions of this resonance are not known.
- [f] This mode is not a useful test for a  $\Delta C=1$  weak neutral current because both quarks must change flavor in this decay.
- [g] The value is for the sum of the charge states or particle/antiparticle states indicated.

## CONSTRAINED FIT INFORMATION

An overall fit to 12 branching ratios uses 24 measurements and one constraint to determine 9 parameters. The overall fit has a  $\chi^2 = 13.0$  for 16 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_9$	70

## $D_s^+$ DECAY CONSTANT

Written October 2003 by A. Edwards and P. Burchat (Stanford University)

In the Standard Model, the  $D_s^+$  leptonic branching fractions are related to the  $D_s^+$  decay constant  $f_{D_s}$  by the equation [1]

$$B(D_s^+ \rightarrow \ell^+ \nu_\ell) = \frac{G_F^2}{8\pi} |V_{cs}|^2 f_{D_s}^2 \frac{\tau_{D_s}}{\hbar} m_{D_s} m_\ell^2 \left(1 - \frac{m_\ell^2}{m_{D_s}^2}\right)^2. \quad (1)$$

Hence, measurements of  $B(D_s^+ \rightarrow \ell^+ \nu_\ell)$  can be used to extract  $f_{D_s}$ . Eight experiments have published measurements of the branching fraction for  $D_s^+$  decaying to  $\mu^+ \nu_\mu$  or  $\tau^+ \nu_\tau$ : WA75 (AOKI 93), BES (BAI 95), E653 (KODAMA 96), L3 (ACCIARRI 97F), CLEO (CHADHA 98), BEATRICE (ALEXANDROV 00), OPAL (ABBIENDI 01L), and ALEPH (HEISTER 02I). All these experiments except BES either explicitly or implicitly measure the leptonic branching fraction relative to the branching fraction for  $D_s^+ \rightarrow \phi \pi^+$ , or for semileptonic  $D_s^+$  or  $D^0$  decays. The semileptonic  $D_s^+$  branching fraction is in turn measured relative to  $B(D_s^+ \rightarrow \phi \pi^+)$ . The fractional experimental uncertainty on  $B(D_s^+ \rightarrow \phi \pi^+)$  is currently 25%.

The LEP experiments (L3, OPAL, ALEPH) share a 23% correlated uncertainty in the normalization of the leptonic branching fraction. They use the partial decay rate for  $Z \rightarrow c\bar{c}$  and the  $D_s^+$  production rate in  $Z \rightarrow c\bar{c}$  events, which in turn depends on the assumed value of  $B(D_s^+ \rightarrow \phi\pi^+)$ . BES uses the relative number of events in which one or two  $D_s$  decays are fully reconstructed to determine the absolute  $D_s^+ \rightarrow \mu^+\nu_\mu$  branching fraction; however, only three events are observed in which one  $D_s^+$  decays to a hadronic final state and the other decays to  $\mu^+\nu_\mu$  or  $\tau^+\nu_\tau$ .

We determine the world average value of  $f_{D_s}$  from the experimental measurements of the  $D_s^+$  leptonic branching fractions, assuming lepton universality, taking into account correlated uncertainties, and using a consistent and up-to-date set of input parameters [2] for the  $\mu$ ,  $\tau$ , and  $D_s^+$  masses, the  $D_s^+$  lifetime,  $V_{cs}$ ,  $B(D_s^+ \rightarrow \phi\pi^+)$ , and the relative  $D_s^+$  branching fractions. Although the uncertainty on  $B(D_s^+ \rightarrow \phi\pi^+)$  is by far the largest correlated uncertainty, we also take into account correlated uncertainties in the input parameters. Weighting each measurement by its uncorrelated uncertainty, we determine the average leptonic branching fraction for all experiments except BES to be  $B(D_s^+ \rightarrow \mu^+\nu_\mu) = 0.00547 \pm 0.00067 \pm 0.00132$ , where the second uncertainty in the average is the correlated uncertainty due to  $B(D_s^+ \rightarrow \phi\pi^+)$ . Since the above average is less (by  $1.5\sigma$ ) than the BES result of  $B(D_s^+ \rightarrow \mu^+\nu_\mu) = 0.015_{-0.006}^{+0.013+0.003}$ , the negative uncertainties on the BES measurement are used to calculate the weighted average for all experiments:

$$B(D_s^+ \rightarrow \mu^+\nu_\mu) = 0.00596 \pm 0.00144 . \quad (2)$$

Using this value of the branching fraction and including the relatively minor uncertainties on the other parameters in Eq. (1),

we extract the world average  $D_s^+$  decay constant:

$$f_{D_s} = (267 \pm 33) \text{ MeV} . \quad (3)$$

$0.004 \begin{smallmatrix} +0.0018 & +0.0020 \\ -0.0014 & -0.0019 \end{smallmatrix}$	8	<sup>7</sup> AOKI	93 WA75	$\pi^-$ emulsion 350 GeV
$<0.03$	0	<sup>8</sup> AUBERT	83 SPEC	$\mu^+$ Fe, 250 GeV

<sup>5</sup> This HEISTER 02I result is not actually an independent measurement of the absolute  $\mu^+ \nu_\mu$  branching fraction, but is in fact based on our  $\phi \pi^+$  branching fraction of 3.6 ± 0.9%, so it cannot be included in our overall fit. HEISTER 02I combines its  $D_s^+ \rightarrow \tau^+ \nu_\tau$  and  $\mu^+ \nu_\mu$  branching fractions to get  $f_{D_s} = (285 \pm 19 \pm 40) \text{ MeV}$ .

<sup>6</sup> BAI 95 uses one actual  $D_s^+ \rightarrow \mu^+ \nu_\mu$  event together with two  $D_s^+ \rightarrow \tau^+ \nu_\tau$  events and assumes  $\mu$ - $\tau$  universality. This value of  $\Gamma(\mu^+ \nu_\mu)/\Gamma_{\text{total}}$  gives a pseudoscalar decay constant of  $(430 \begin{smallmatrix} +150 \\ -130 \end{smallmatrix} \pm 40) \text{ MeV}$ .

<sup>7</sup> AOKI 93 assumes the ratio of production cross sections of the  $D_s^+$  and  $D^0$  is 0.27. The value of  $\Gamma(\mu^+ \nu_\mu)/\Gamma_{\text{total}}$  gives a pseudoscalar decay constant  $f_{D_s} = (232 \pm 45 \pm 52) \text{ MeV}$ .

<sup>8</sup> AUBERT 83 assume that the  $D_s^\pm$  production rate is 20% of total charm production rate.

### $\Gamma(\mu^+ \nu_\mu)/\Gamma(\phi \pi^+)$ $\Gamma_7/\Gamma_{15}$

See the “Note on Pseudoscalar-Meson Decay Constants” in the Listings for the  $\pi^\pm$ .

0.033 ± 0.011		30	31 DERRICK	85B HRS	$e^+e^-$ 29 GeV

26 ARTUSO 96 uses partially reconstructed  $\bar{B}^0 \rightarrow D^{*+}D_s^{*-}$  decays to get a model-independent value for  $\Gamma(D_s^- \rightarrow \phi\pi^-)/\Gamma(D^0 \rightarrow K^-\pi^+)$  of  $0.92 \pm 0.20 \pm 0.11$ .

27 BAI 95C uses  $e^+e^- \rightarrow D_s^+D_s^-$  events in which one or both of the  $D_s^\pm$  are observed to obtain the first model-independent measurement of the  $D_s^+ \rightarrow \phi\pi^+$  branching fraction, without assumptions about  $\sigma(D_s^\pm)$ . However, with only two “doubly-tagged” events, the statistical error is very large. ADLER 90B used the same method to set a limit.

28 BUTLER 94, FRABETTI 93G, ALBRECHT 91, ALEXANDER 90B, and ANJOS 90B measure the ratio  $\Gamma(D_s^+ \rightarrow \phi\ell^+\nu_\ell)/\Gamma(D_s^+ \rightarrow \phi\pi^+)$ , where  $\ell = e$  and/or  $\mu$ , and then use a theoretical calculation of the ratio of widths  $\Gamma(D_s^+ \rightarrow \phi\ell^+\nu_\ell)/\Gamma(D^+ \rightarrow \bar{K}^{*0}\ell^+\nu)$ . Not everyone uses the same value for this ratio.

29 The two MUHEIM 94 values here are model-dependent calculations based on distinct data sets. The first uses measurements of the  $D_2^*(2460)^0$  and  $D_{s1}(2536)^+$ , the second uses  $B$ -decay factorization and  $\Gamma(D_s^+ \rightarrow \mu^+\nu_\mu)/\Gamma(D_s^+ \rightarrow \phi\ell^+\nu_\ell)$ . A third calculation using the semileptonic width of  $D_s^+ \rightarrow \phi\ell^+\nu_\ell$  is not independent of other results listed here. Note also the upper limit, based on the sum of established  $D_s^+$  branching ratios.

30 ALVAREZ 90C relies on the Lund model to estimate the ratio of  $D_s^+$  to  $D^+$  cross sections.

31 Values based on crude estimates of the  $D_s^\pm$  production level. DERRICK 85B errors are statistical only.
