$\Theta_c(3100)^0$

$$I(J^P) = 0(?^?)$$

OMITTED FROM SUMMARY TABLE

AKTAS 04A in $e^\pm p$ reactions at c.m. energies of 300 and 320 GeV sees the peak in $D^*(2010)^- p$ and $D^*(2010)^+ \overline{p}$ mass spectra. The minimum quark content would be $u\,u\,d\,d\,\overline{c}$.

However:

- SCHAEL 04 in a search in $D^- p$ and $D^{*-} p$ (and charge conjugate) events from 3.5M Z decays sees no evidence for the peak.
- CHEKANOV 04D finds no evidence in $D^{*-} p$ (and charge-conjugate) events with more than 60,000 reconstructed $D^{*\pm}$ mesons.
- LINK 05D finds no evidence in $D^- p$ and $D^{*-} p$ (and charge-conjugate) events in a cleaner and 30 times larger sample than that of AKTAS 04A.
- AUBERT,B 06I finds no evidence in 125,000 $D^{*-} p$ (and charge-conjugate) events produced in $e^+ e^-$ reactions at 10.58 GeV.
- DELELLIS 07 finds no evidence in 2262 $\overline{\nu}$ emulsion charged-current events. (This is actually a search for a Θ_c below the $D^- p$ threshold, not for the $\Theta_c(3100)$.)

$\Theta_c(3100)^0$ MASS

VALUE (MeV)	EVTS	DOCUMENT ID		TECN	COMMENT
3099±3±5	51	[1] AKTAS	04A	H1	$D^{*-} p$ & $D^{*+} \overline{p}$

[1] AKTAS 04A estimates a peak of 51 events above a background of 45 events, and claims a statistical significance of about 5.4 standard deviations; another estimate of significance gives 6.2 standard deviations. (However, no account has been taken of the number of bins searched in.) The gaussian width of the peak, 12 MeV, is consistent with the resolution.
