$\Upsilon(4S)$ BRANCHING RATIOS

— $B\overline{B}$ DECAYS —

The ratio of branching fraction to charged and neutral B mesons is often derived assuming isospin invariance in the decays, and relies on the knowledge of the B^+/B^0 lifetime ratio. "OUR EVALUATION" is obtained based on averages of rescaled data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account the common dependence of the measurement on the value of the lifetime ratio.

$\Gamma(B^+ B^-)/\Gamma_{total}$ — Γ_2/Γ

VALUE	DOCUMENT ID
0.509±0.007 OUR EVALUATION	Assuming B($\Upsilon(4S) \to B\overline{B}$) = 1

$\Gamma(D_s^+ \text{ anything} + \text{c.c.})/\Gamma_{total}$ — Γ_3/Γ

VALUE	DOCUMENT ID		TECN	COMMENT
0.178±0.021±0.016	[4] ARTUSO	05B	CLE3	$e^+ e^- \to D_X X$

[4] ARTUSO 05B reports [B($\Upsilon(4S) \to D_s^+$ anything + c.c.) × B($D_s^+ \to \phi\pi^+$)] = $(8.0 \pm 0.2 \pm 0.9) \times 10^{-3}$. We divide by our best value B($D_s^+ \to \phi\pi^+$) = $(4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

$\Gamma(B^0 \overline{B}^0)/\Gamma_{total}$ — Γ_4/Γ

VALUE	DOCUMENT ID		TECN	COMMENT
