

# Heavy Bosons Other Than Higgs Bosons, Searches for

We list here various limits on charged and neutral heavy vector bosons (other than  $W$ 's and  $Z$ 's), heavy scalar bosons (other than Higgs bosons), vector or scalar leptoquarks, and axigluons.

A REVIEW GOES HERE – Check our WWW List of Reviews

## MASS LIMITS for $W'$ (Heavy Charged Vector Boson Other Than $W$ ) in Hadron Collider Experiments

Couplings of  $W'$  to quarks and leptons are taken to be identical with those of  $W$ . The following limits are obtained from  $p\bar{p} \rightarrow W'X$  with  $W'$  decaying to the mode indicated in the comments. New decay channels (e.g.,  $W' \rightarrow WZ$ ) are assumed to be suppressed. UA1 and UA2 experiments assume that the  $t\bar{b}$  channel is not open.

>209	90	<sup>13</sup> ANSARI	87D UA2	$W' \rightarrow e\nu$

<sup>1</sup> The ABAZOV 06N quoted limit is for  $W'$  with SM-like coupling which interferes with the SM  $W$  boson. For  $W'$  with right-handed coupling,  $M_{W'}$  between 200 and 630 (670) GeV is excluded for  $M_{\nu_R} \ll M_{W'}$  ( $M_{\nu_R} > M_{W'}$ ).

<sup>2</sup> The ACOSTA 03B quoted limit is for  $M_{W'} \gg M_{\nu_R}$ . For  $M_{W'} < M_{\nu_R}$ ,  $M_{W'}$  between 225 and 566 GeV is excluded.

<sup>3</sup> The quoted limit is obtained assuming  $W'WZ$  coupling strength is the same as the ordinary  $WWZ$  coupling strength in the Standard Model. See their Fig. 2 for the limits on the production cross sections as a function of the  $W'$  width.

<sup>4</sup> AFFOLDER 01I combine a new bound on  $W' \rightarrow e\nu$  of 754 GeV with the bound of ABE 00 on  $W' \rightarrow \mu\nu$  to obtain quoted bound.

<sup>5</sup> ABE 00 assume that the neutrino from  $W'$  decay is stable and has a mass significantly less than  $m_{W'}$ .

<sup>6</sup> ABE 97G search for new particle decaying to dijets.

<sup>7</sup> For bounds on  $W_R$  with nonzero right-handed mass, see Fig. 5 from ABACHI 96C.

<sup>8</sup> ABACHI 95E assume that the decay  $W' \rightarrow WZ$  is suppressed and that the neutrino from  $W'$  decay is stable and has a mass significantly less  $m_{W'}$ .

- <sup>9</sup> ABE 95M assume that the decay  $W' \rightarrow WZ$  is suppressed and the (right-handed) neutrino is light, noninteracting, and stable. If  $m_{\nu} = 60$  GeV, for example, the effect on the mass limit is negligible.
- <sup>10</sup> ALITTI 93 search for resonances in the two-jet invariant mass. The limit assumes  $\Gamma(W')/m_{W'} = \Gamma(W)/m_W$  and  $B(W' \rightarrow jj) = 2/3$ . This corresponds to  $W_R$  with  $m_{\nu_R} > m_{W_R}$  (no leptonic decay) and  $W_R \rightarrow t\bar{b}$  allowed. See their Fig. 4 for limits in the  $m_{W'} - B(q\bar{q})$  plane.
- <sup>11</sup> RIZZO 93 analyses CDF limit on possible two-jet resonances. The limit is sensitive to the inclusion of the assumed  $K$  factor.
- <sup>12</sup> ALBAJAR 89 cross section limit at 630 GeV is  $\sigma(W') B(e\nu) < 4.1$  pb (90% CL).
- <sup>13</sup> See Fig. 5 of ANSARI 87D for the excluded region in the  $m_{W'} - [(g_{W'q})^2 B(W' \rightarrow e\bar{\nu})]$  plane. Note that the quantity  $(g_{W'q})^2 B(W' \rightarrow e\bar{\nu})$  is normalized to unity for the standard  $W$  couplings.

## $W_R$ (Right-Handed $W$ Boson) MASS LIMITS

Assuming a light right-handed neutrino, except for BEALL 82, LANGACKER 89B, and COLANGELO 91.  $g_R = g_L$  assumed. [Limits in the section MASS LIMITS for  $W'$  below are also valid for  $W_R$  if  $m_{\nu_R} \ll m_{W_R}$ .] Some limits assume manifest left-right symmetry, *i.e.*, the equality of left- and right Cabibbo-Kobayashi-Maskawa matrices. For a comprehensive review, see LANGACKER 89B. Limits on the  $W_L$ - $W_R$  mixing angle  $\zeta$  are found in the next section. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

- <sup>14</sup> CZAKON 99 perform a simultaneous fit to charged and neutral sectors.
- <sup>15</sup> CYBURT 05 limit follows by requiring that three light  $\nu_R$ 's decouple when  $T_{dec} > 140$  MeV. For different  $T_{dec}$ , the bound becomes  $m_{W_R} > 3.3 \text{ TeV} (T_{dec} / 140 \text{ MeV})^{3/4}$ .
- <sup>16</sup> THOMAS 01 limit is from measurement of  $\beta^+$  polarization in decay of polarized  $^{12}\text{N}$ . The listed limit assumes no mixing.
- <sup>17</sup> ACKERSTAFF 99D limit is from  $\tau$  decay parameters. Limit increase to 145 GeV for zero mixing.
- <sup>18</sup> BARENBOIM 98 assumes minimal left-right model with Higgs of  $SU(2)_R$  in  $SU(2)_L$  doublet. For Higgs in  $SU(2)_L$  triplet,  $m_{W_R} > 1100$  GeV. Bound calculated from effect of corresponding  $Z_{LR}$  on electroweak data through  $Z-Z_{LR}$  mixing.
- <sup>19</sup> The quoted limit is from  $\mu$  decay parameters. BARENBOIM 97 also evaluate limit from  $K_L-K_S$  mass difference.
- <sup>20</sup> STAHL 97 limit is from fit to  $\tau$ -decay parameters.
- <sup>21</sup> ALLET 96 measured polarization-asymmetry correlation in  $^{12}\text{N}\beta^+$  decay. The listed limit assumes zero  $L$ - $R$  mixing.
- <sup>22</sup> KUZNETSOV 95 limit is from measurements of the asymmetry  $\langle \vec{p}_\nu \cdot \sigma_n \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing assumed. See also KUZNETSOV 94B.
- <sup>23</sup> KUZNETSOV 94B limit is from measurements of the asymmetry  $\langle \vec{p}_\nu \cdot \sigma_n \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing assumed.
- <sup>24</sup> BHATTACHARYYA 93 uses  $Z$ - $Z'$  mixing limit from LEP '90 data, assuming a specific Higgs sector of  $SU(2)_L \times SU(2)_R \times U(1)$  gauge model. The limit is for  $m_t = 200$  GeV and slightly improves for smaller  $m_t$ .
- <sup>25</sup> SEVERIJNS 93 measured polarization-asymmetry correlation in  $^{107}\text{In}\beta^+$  decay. The listed limit assumes zero  $L$ - $R$  mixing. Value quoted here is from SEVERIJNS 94 erratum.
- <sup>26</sup> IMAZATO 92 measure positron asymmetry in  $K^+ \rightarrow \mu^+ \nu_\mu$  decay and obtain  $\xi P_\mu > 0.990$  (90% CL). If  $W_R$  couples to  $u\bar{s}$  with full weak strength ( $V_{us}^R = 1$ ), the result corresponds to  $m_{W_R} > 653$  GeV. See their Fig. 4 for  $m_{W_R}$  limits for general  $|V_{us}^R|^2 = 1 - |V_{ud}^R|^2$ .
- <sup>27</sup> POLAK 92B limit is from fit to muon decay parameters and is essentially determined by JODIDIO 86 data assuming  $\zeta = 0$ . Supersedes POLAK 91.
- <sup>28</sup> AQUINO 91 limits obtained from neutron lifetime and asymmetries together with unitarity of the CKM matrix. Manifest left-right symmetry assumed. Stronger of the two limits also includes muon decay results.
- <sup>29</sup> COLANGELO 91 limit uses hadronic matrix elements evaluated by QCD sum rule and is less restrictive than BEALL 82 limit which uses vacuum saturation approximation. Manifest left-right symmetry assumed.
- <sup>30</sup> POLAK 91 limit is from fit to muon decay parameters and is essentially determined by JODIDIO 86 data assuming  $\zeta = 0$ . Superseded by POLAK 92B.
- <sup>31</sup> BARBIERI 89B limit holds for  $m_{\nu_R} \leq 10$  MeV.
- <sup>32</sup> LANGACKER 89B limit is for any  $\nu_R$  mass (either Dirac or Majorana) and for a general class of right-handed quark mixing matrices.
- <sup>33</sup> BALKE 88 limit is for  $m_{\nu_{eR}} = 0$  and  $m_{\nu_{\mu R}} \leq 50$  MeV. Limits come from precise measurements of the muon decay asymmetry as a function of the positron energy.
- <sup>34</sup> JODIDIO 86 is the same TRIUMF experiment as STOKER 85 (and CARR 83); however, it uses a different technique. The results given here are combined results of the

two techniques. The technique here involves precise measurement of the end-point  $e^+$  spectrum in the decay of the highly polarized  $\mu^+$ .

- 35 STOKER 85 is same TRIUMF experiment as CARR 83. Here they measure the decay  $e^+$  spectrum asymmetry above 46 MeV/c using a muon-spin-rotation technique. Assumed a light right-handed neutrino. Quoted limits are from combining with CARR 83.
- 36 BERGSMA 83 set limit  $m_{W_2}/m_{W_1} > 1.9$  at CL = 90%.
- 37 CARR 83 is TRIUMF experiment with a highly polarized  $\mu^+$  beam. Looked for deviation from V-A at the high momentum end of the decay  $e^+$  energy spectrum. Limit from previous world-average muon polarization parameter is  $m_{W_R} > 240$  GeV. Assumes a light right-handed neutrino.
- 38 BEALL 82 limit is obtained assuming that  $W_R$  contribution to  $K_L^0-K_S^0$  mass difference is smaller than the standard one, neglecting the top quark contributions. Manifest left-right symmetry assumed.

### Limit on $W_L$ - $W_R$ Mixing Angle $\zeta$

Lighter mass eigenstate  $W_1 = W_L \cos \zeta - W_R \sin \zeta$ . Light  $\nu_R$  assumed unless noted. Values in brackets are from cosmological and astrophysical considerations.

46 ABDALLAH 06C use data  $\sqrt{s} = 130\text{--}207$  GeV.

47 ABULENCIA 06L search for resonances decaying to  $e^+ e^-$  in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.

48 CHEUNG 01B limit is derived from bounds on contact interactions in a global electroweak analysis.

49 ABULENCIA 05A search for resonances decaying to electron or muon pairs in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.

50 ACOSTA 05R search for resonances decaying to tau lepton pairs in  $\bar{p}p$  collisions at  $\sqrt{s} = 1.96$  TeV.

51 ABBIENDI 04G give 95%CL limit on  $Z - Z'$  mixing  $-0.00422 < \theta < 0.00091$ .  $\sqrt{s} = 91$  to 207 GeV.

52 ABAZOV 01B search for resonances in  $p\bar{p} \rightarrow e^+ e^-$  at  $\sqrt{s}=1.8$  TeV. They find  $\sigma \cdot B(Z' \rightarrow ee) < 0.06$  pb for  $M_{Z'} > 500$  GeV.

53 ABREU 00S uses LEP data at  $\sqrt{s}=90$  to 189 GeV.

54 BARATE 00I search for deviations in cross section and asymmetries in  $e^+ e^- \rightarrow$  fermions at  $\sqrt{s}=90$  to 183 GeV. Assume  $\theta=0$ . Bounds in the mass-mixing plane are shown in their Figure 18.

55 ERLER 99 give 90%CL limit on the  $Z-Z'$  mixing  $-0.0041 < \theta < 0.0003$ .  $\rho_0=1$  is assumed.

56 ABE 97S find  $\sigma(Z') \times B(e^+ e^-, \mu^+ \mu^-) < 40$  fb for  $m_{Z'} > 600$  GeV at  $\sqrt{s}= 1.8$  TeV.

57 VILAIN 94B assume  $m_t = 150$  GeV.

58 ALITTI 93 search for resonances in the two-jet invariant mass. The limit assumes  $B(Z' \rightarrow q\bar{q})=0.7$ . See their Fig. 5 for limits in the  $m_{Z'} - B(q\bar{q})$  plane.

59 RIZZO 93 analyses CDF limit on possible two-jet resonances.

60 ABE 90F use data for  $R, R_{\ell\ell}$ , and  $A_{\ell\ell}$ . They fix  $m_W = 80.49 \pm 0.43 \pm 0.24$  GeV and  $m_Z = 91.13 \pm 0.03$  GeV.

## Limits for $Z_{LR}$

$Z_{LR}$  is the extra neutral boson in left-right symmetric models.  $g_L = g_R$  is assumed unless noted. Values in parentheses assume stronger constraint on the Higgs sector, usually motivated by specific left-right symmetric models (see the Note on the  $W'$ ). Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino. Direct search bounds assume decays to Standard Model fermions only, unless noted.

<sup>61</sup> ABBIENDI 04G give 95% CL limit on  $Z - Z'$  mixing  $-0.00098 < \theta < 0.00190$ . See their Fig. 20 for the limit contour in the mass-mixing plane.  $\sqrt{s} = 91$  to 207 GeV.

<sup>62</sup> CHEUNG 01B limit is derived from bounds on contact interactions in a global electroweak analysis.

<sup>63</sup> ABE 97S find  $\sigma(Z') \times B(e^+ e^-, \mu^+ \mu^-) < 40$  fb for  $m_{Z'} > 600$  GeV at  $\sqrt{s} = 1.8$  TeV.

<sup>64</sup> ABDALLAH 06c give 95% CL limit  $|\theta| < 0.0028$ . See their Fig. 14 for limit contours in the mass-mixing plane.

<sup>65</sup> ABREU 00S give 95% CL limit on  $Z - Z'$  mixing  $|\theta| < 0.0018$ . See their Fig. 6 for the limit contour in the mass-mixing plane.  $\sqrt{s} = 90$  to 189 GeV.

<sup>66</sup> BARATE 00i search for deviations in cross section and asymmetries in  $e^+ e^- \rightarrow$  fermions at  $\sqrt{s} = 90$  to 183 GeV. Assume  $\theta = 0$ . Bounds in the mass-mixing plane are shown in their Figure 18.

<sup>67</sup> CHAY 00 also find  $-0.0003 < \theta < 0.0019$ . For  $g_R$  free,  $m_{Z'} > 430$  GeV.

<sup>68</sup> ERLER 00 discuss the possibility that a discrepancy between the observed and predicted values of  $Q_W(\text{Cs})$  is due to the exchange of  $Z'$ . The data are better described in a certain class of the  $Z'$  models including  $Z_{LR}$  and  $Z_\chi$ .

<sup>69</sup> CASALBUONI 99 discuss the discrepancy between the observed and predicted values of  $Q_W(\text{Cs})$ . It is shown that the data are better described in a class of models including the  $Z_{LR}$  model.

- 70 CZAKON 99 perform a simultaneous fit to charged and neutral sectors. Assumes manifest left-right symmetric model. Finds  $|\theta| < 0.0042$ .
- 71 ERLER 99 give 90% CL limit on the  $Z$ - $Z'$  mixing  $-0.0009 < \theta < 0.0017$ .
- 72 ERLER 99 assumes 2 Higgs doublets, transforming as 10 of  $SO(10)$ , embedded in  $E_6$ .
- 73 BARENBOIM 98 also gives 68% CL limits on the  $Z$ - $Z'$  mixing  $-0.0005 < \theta < 0.0033$ . Assumes Higgs sector of minimal left-right model.
- 74 CONRAD 98 limit is from measurements at CCFR, assuming no  $Z$ - $Z'$  mixing.
- 75 VILAIN 94B assume  $m_t = 150$  GeV and  $\theta=0$ . See Fig. 2 for limit contours in the mass-mixing plane.
- 76 RIZZO 93 analyses CDF limit on possible two-jet resonances.
- 77 GRIFOLS 90 limit holds for  $m_{\nu_R} \lesssim 1$  MeV. A specific Higgs sector is assumed. See also GRIFOLS 90D, RIZZO 91.
- 78 BARBIERI 89B limit holds for  $m_{\nu_R} \leq 10$  MeV. Bounds depend on assumed supernova core temperature.

### Limits for $Z_\chi$

$Z_\chi$  is the extra neutral boson in  $SO(10) \rightarrow SU(5) \times U(1)_\chi$ .  $g_\chi = e/\cos\theta_W$  is assumed unless otherwise stated. We list limits with the assumption  $\rho=1$  but with no further constraints on the Higgs sector. Values in parentheses assume stronger constraint on the Higgs sector motivated by superstring models. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

- 79 ABULENCIA 06L search for resonances decaying to  $e^+e^-$  in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.
- 80 ABBIENDI 04G give 95% CL limit on  $Z-Z'$  mixing  $-0.00099 < \theta < 0.00194$ . See their Fig. 20 for the limit contour in the mass-mixing plane.  $\sqrt{s} = 91$  to 207 GeV.
- 81 ABDALLAH 06C give 95% CL limit  $|\theta| < 0.0031$ . See their Fig. 14 for limit contours in the mass-mixing plane.
- 82 ABULENCIA 05A search for resonances decaying to electron or muon pairs in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV.
- 83 BARGER 03B limit is from the nucleosynthesis bound on the effective number of light neutrino  $\delta N_\nu < 1$ . The quark-hadron transition temperature  $T_c = 150$  MeV is assumed. The limit with  $T_c = 400$  MeV is  $> 4300$  GeV.
- 84 CHEUNG 01B limit is derived from bounds on contact interactions in a global electroweak analysis.
- 85 ABREU 00S give 95% CL limit on  $Z-Z'$  mixing  $|\theta| < 0.0017$ . See their Fig. 6 for the limit contour in the mass-mixing plane.  $\sqrt{s} = 90$  to 189 GeV.
- 86 BARATE 00I search for deviations in cross section and asymmetries in  $e^+e^- \rightarrow$  fermions at  $\sqrt{s} = 90$  to 183 GeV. Assume  $\theta = 0$ . Bounds in the mass-mixing plane are shown in their Figure 18.
- 87 CHO 00 use various electroweak data to constrain  $Z'$  models assuming  $m_H = 100$  GeV. See Fig. 3 for limits in the mass-mixing plane.
- 88 ERLER 00 discuss the possibility that a discrepancy between the observed and predicted values of  $Q_W(\text{Cs})$  is due to the exchange of  $Z'$ . The data are better described in a certain class of the  $Z'$  models including  $Z_{LR}$  and  $Z_\chi$ .
- 89 ROSNER 00 discusses the possibility that a discrepancy between the observed and predicted values of  $Q_W(\text{Cs})$  is due to the exchange of  $Z'$ . The data are better described in a certain class of the  $Z'$  models including  $Z_\chi$ .
- 90 ERLER 99 give 90% CL limit on the  $Z-Z'$  mixing  $-0.0020 < \theta < 0.0015$ .
- 91 ERLER 99 assumes 2 Higgs doublets, transforming as 10 of  $SO(10)$ , embedded in  $E_6$ .
- 92 CONRAD 98 limit is from measurements at CCFR, assuming no  $Z-Z'$  mixing.
- 93 ABE 97S find  $\sigma(Z') \times B(e^+e^-, \mu^+\mu^-) < 40$  fb for  $m_{Z'} > 600$  GeV at  $\sqrt{s} = 1.8$  TeV.
- 94  $Z-Z'$  mixing is assumed to be zero.  $\sqrt{s} = 57.77$  GeV.
- 95 VILAIN 94B assume  $m_t = 150$  GeV and  $\theta = 0$ . See Fig. 2 for limit contours in the mass-mixing plane.
- 96 FARAGGI 91 limit assumes the nucleosynthesis bound on the effective number of neutrinos  $\Delta N_\nu < 0.5$  and is valid for  $m_{\nu_R} < 1$  MeV.
- 97 ABE 90F use data for  $R$ ,  $R_{\ell\ell}$ , and  $A_{\ell\ell}$ . ABE 90F fix  $m_W = 80.49 \pm 0.43 \pm 0.24$  GeV and  $m_Z = 91.13 \pm 0.03$  GeV.
- 98 Assumes the nucleosynthesis bound on the effective number of light neutrinos ( $\delta N_\nu < 1$ ) and that  $\nu_R$  is light ( $\lesssim 1$  MeV).
- 99 GRIFOLS 90 limit holds for  $m_{\nu_R} \lesssim 1$  MeV. See also GRIFOLS 90D, RIZZO 91.

### Limits for $Z_\psi$

$Z_\psi$  is the extra neutral boson in  $E_6 \rightarrow SO(10) \times U(1)_\psi$ .  $g_\psi = e/\cos\theta_W$  is assumed unless otherwise stated. We list limits with the assumption  $\rho = 1$  but with no further constraints on the Higgs sector. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

## Limits for $Z_\eta$

$Z_\eta$  is the extra neutral boson in  $E_6$  models, corresponding to  $Q_\eta = \sqrt{3/8} Q_\chi - \sqrt{5/8} Q_\psi$ .  $g_\eta = e/\cos\theta_W$  is assumed unless otherwise stated. We list limits with the assumption  $\rho = 1$  but with no further constraints on the Higgs sector. Values in parentheses assume stronger constraint on the Higgs sector motivated by superstring

models. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

135	ABE 97G	CDF	$Z' \rightarrow \bar{q}q$
130	ABULENCIA 06M search for new particle with lepton flavor violating decay at $\sqrt{s} = 1.96$ TeV. See their Fig. 4 for an exclusion plot on a mass-coupling plane.		
131	Search for narrow resonance decaying to $t\bar{t}$ . See their Fig.2 for limit on $\sigma B$ .		
132	BARGER 03B use the nucleosynthesis bound on the effective number of light neutrino $\delta N_\nu$ . See their Figs. 4–5 for limits in general $E_6$ motivated models.		
133	CHO 00 use various electroweak data to constrain $Z'$ models assuming $m_H=100$ GeV. See Fig. 2 for limits in general $E_6$ -motivated models.		
134	CHO 98 study constraints on four-Fermi contact interactions obtained from low-energy electroweak experiments, assuming no $Z$ - $Z'$ mixing.		
135	Search for $Z'$ decaying to dijets at $\sqrt{s}=1.8$ TeV. For $Z'$ with electromagnetic strength coupling, no bound is obtained.		

## Indirect Constraints on Kaluza-Klein Gauge Bosons

Bounds on a Kaluza-Klein excitation of the  $Z$  boson or photon in  $d=1$  extra dimension. These bounds can also be interpreted as a lower bound on  $1/R$ , the size of the extra dimension. Unless otherwise stated, bounds assume all fermions live on a single brane and all gauge fields occupy the  $4+d$ -dimensional bulk. See also the section on “Extra Dimensions” in the “Searches” Listings in this Review.

VALUE (TeV)	CL%	DOCUMENT ID	TECN	COMMENT
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
> 4.7		136 MUECK 02	RVUE	Electroweak
> 3.3	95	137 CORNET 00	RVUE	$e\nu qq'$
>5000		138 DELGADO 00	RVUE	$\epsilon_K$
> 2.6	95	139 DELGADO 00	RVUE	Electroweak
> 3.3	95	140 RIZZO 00	RVUE	Electroweak
> 2.9	95	141 MARCIANO 99	RVUE	Electroweak
> 2.5	95	142 MASIP 99	RVUE	Electroweak
> 1.6	90	143 NATH 99	RVUE	Electroweak
> 3.4	95	144 STRUMIA 99	RVUE	Electroweak
136	MUECK 02 limit is $2\sigma$ and is from global electroweak fit ignoring correlations among observables. Higgs is assumed to be confined on the brane and its mass is fixed. For scenarios of bulk Higgs, of brane-SU(2) <sub>L</sub> , bulk-U(1) <sub>Y</sub> , and of bulk-SU(2) <sub>L</sub> , brane-U(1) <sub>Y</sub> , the corresponding limits are > 4.6 TeV, > 4.3 TeV and > 3.0 TeV, respectively.			
137	Bound is derived from limits on $e\nu qq'$ contact interaction, using data from HERA and the Tevatron.			
138	Bound holds only if first two generations of quarks lives on separate branes. If quark mixing is not complex, then bound lowers to 400 TeV from $\Delta m_K$ .			
139	See Figs. 1 and 2 of DELGADO 00 for several model variations. Special boundary conditions can be found which permit KK states down to 950 GeV and that agree with the measurement of $Q_W(C_s)$ . Quoted bound assumes all Higgs bosons confined to brane; placing one Higgs doublet in the bulk lowers bound to 2.3 TeV.			

- 140 Bound is derived from global electroweak analysis assuming the Higgs field is trapped on the matter brane. If the Higgs propagates in the bulk, the bound increases to 3.8 TeV.
- 141 Bound is derived from global electroweak analysis but considering only presence of the KK  $W$  bosons.
- 142 Global electroweak analysis used to obtain bound independent of position of Higgs on brane or in bulk.
- 143 Bounds from effect of KK states on  $G_F$ ,  $\alpha$ ,  $M_W$ , and  $M_Z$ . Hard cutoff at string scale determined using gauge coupling unification. Limits for  $d=2,3,4$  rise to 3.5, 5.7, and 7.8 TeV.
- 144 Bound obtained for Higgs confined to the matter brane with  $m_H=500$  GeV. For Higgs in the bulk, the bound increases to 3.5 TeV.

- 145 ABAZOV 06A search for scalar leptoquarks using  $\mu\mu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV and at 1.96 TeV. The limit above assumes  $B(\mu q) = 1$ . For  $B(\mu q) = 0.5$ , the limit becomes 204 GeV.
- 146 ABULENCIA 06T search for scalar leptoquarks using  $\mu\mu jj$ ,  $\mu\nu jj$ , and  $\nu\nu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.96$  TeV. The quoted limit assumes  $B(\mu q) = 1$ . For  $B(\mu q) = 0.5$  or 0.1, the bound becomes 208 GeV or 143 GeV, respectively. See their Fig. 4 for the exclusion limit as a function of  $B(\mu q)$ .
- 147 ABAZOV 05H search for scalar leptoquarks using  $eejj$  and  $e\nu jj$  events in  $\bar{p}p$  collisions at  $E_{\text{cm}} = 1.8$  TeV and 1.96 TeV. The limit above assumes  $B(eq) = 1$ . For  $B(eq) = 0.5$  the bound becomes 234 GeV.
- 148 ACOSTA 05P search for scalar leptoquarks using  $eejj$ ,  $e\nu jj$  events in  $\bar{p}p$  collisions at  $E_{\text{cm}} = 1.96$  TeV. The limit above assumes  $B(eq) = 1$ . For  $B(eq) = 0.5$  and 0.1, the bound becomes 205 GeV and 145 GeV, respectively.
- 149 AFFOLDER 00K search for scalar leptoquark using  $\nu\nu bb$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The quoted limit assumes  $B(\nu b) = 1$ . Bounds for vector leptoquarks are also given.
- 150 ABAZOV 06L search for scalar leptoquarks using  $\nu\nu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV and at 1.96 TeV. The limit above assumes  $B(\nu q) = 1$ .
- 151 ACOSTA 05I search for scalar leptoquarks using  $\nu\nu jj$  events in  $\bar{p}p$  collisions at  $E_{\text{cm}} = 1.96$  TeV. The limit above assumes  $B(\nu q) = 1$ .
- 152 ABBIENDI 03R search for scalar/vector leptoquarks in  $e^+e^-$  collisions at  $\sqrt{s} = 189\text{--}209$  GeV. The quoted limits are for charge  $-4/3$  isospin 0 scalar-leptoquark with  $B(\ell q) = 1$ . See their table 12 for other cases.
- 153 ABAZOV 02 search for scalar leptoquarks using  $\nu\nu jj$  events in  $\bar{p}p$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The bound holds for all leptoquark generations. Vector leptoquarks are likewise constrained to lie above 200 GeV.
- 154 ABAZOV 01D search for scalar leptoquarks using  $e\nu jj$ ,  $eejj$ , and  $\nu\nu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The limit above assumes  $B(eq) = 1$ . For  $B(eq) = 0.5$  and 0, the bound becomes 204 and 79 GeV, respectively. Bounds for vector leptoquarks are also given. Supersedes ABBOTT 98E.
- 155 ABBIENDI 00M search for scalar/vector leptoquarks in  $e^+e^-$  collisions at  $\sqrt{s} = 183$  GeV. The quoted limits are for charge  $-4/3$  isospin 0 scalar-leptoquarks with  $B(\ell q) = 1$ . See their Table 8 and Figs. 6–9 for other cases.
- 156 ABBOTT 00C search for scalar leptoquarks using  $\mu\mu jj$ ,  $\mu\nu jj$ , and  $\nu\nu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The limit above assumes  $B(\mu q) = 1$ . For  $B(\mu q) = 0.5$  and 0, the bound becomes 180 and 79 GeV respectively. Bounds for vector leptoquarks are also given.
- 157 AFFOLDER 00K search for scalar leptoquark using  $\nu\nu cc$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The quoted limit assumes  $B(\nu c) = 1$ . Bounds for vector leptoquarks are also given.
- 158 ABBOTT 99J search for leptoquarks using  $\mu\nu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The quoted limit is for a scalar leptoquark with  $B(\mu q) = B(\nu q) = 0.5$ . Limits on vector leptoquarks range from 240 to 290 GeV.
- 159 ABBOTT 98E search for scalar leptoquarks using  $e\nu jj$ ,  $eejj$ , and  $\nu\nu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The limit above assumes  $B(eq) = 1$ . For  $B(eq) = 0.5$  and 0, the bound becomes 204 and 79 GeV, respectively.
- 160 ABBOTT 98J search for charge  $-1/3$  third generation scalar and vector leptoquarks in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The quoted limit is for scalar leptoquark with  $B(\nu b) = 1$ .
- 161 ABE 98S search for scalar leptoquarks using  $\mu\mu jj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The limit is for  $B(\mu q) = 1$ . For  $B(\mu q) = B(\nu q) = 0.5$ , the limit is  $> 160$  GeV.
- 162 GROSS-PILCHER 98 is the combined limit of the CDF and DØ Collaborations as determined by a joint CDF/DØ working group and reported in this FNAL Technical Memo. Original data published in ABE 97X and ABBOTT 98E.
- 163 ABE 97F search for third generation scalar and vector leptoquarks in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The quoted limit is for scalar leptoquark with  $B(\tau b) = 1$ .
- 164 ABE 97X search for scalar leptoquarks using  $eejj$  events in  $p\bar{p}$  collisions at  $E_{\text{cm}} = 1.8$  TeV. The limit is for  $B(eq) = 1$ .

- 165 Limit is for charge  $-1/3$  isospin-0 leptoquark with  $B(\ell q) = 2/3$ .
- 166 First and second generation leptoquarks are assumed to be degenerate. The limit is slightly lower for each generation.
- 167 Limits are for charge  $-1/3$ , isospin-0 scalar leptoquarks decaying to  $\ell^- q$  or  $\nu q$  with any branching ratio. See paper for limits for other charge-isospin assignments of leptoquarks.
- 168 KIM 90 assume pair production of charge  $2/3$  scalar-leptoquark via photon exchange. The decay of the first (second) generation leptoquark is assumed to be any mixture of  $d e^+$  and  $u \bar{\nu}$  ( $s \mu^+$  and  $c \bar{\nu}$ ). See paper for limits for specific branching ratios.
- 169 BARTEL 87B limit is valid when a pair of charge  $2/3$  spinless leptoquarks  $X$  is produced with point coupling, and when they decay under the constraint  $B(X \rightarrow c \bar{\nu}_\mu) + B(X \rightarrow s \mu^+) = 1$ .
- 170 BEHREND 86B assumed that a charge  $2/3$  spinless leptoquark,  $\chi$ , decays either into  $s \mu^+$  or  $c \bar{\nu}$ :  $B(\chi \rightarrow s \mu^+) + B(\chi \rightarrow c \bar{\nu}) = 1$ .

### MASS LIMITS for Leptoquarks from Single Production

These limits depend on the  $q$ - $\ell$ -leptoquark coupling  $g_{LQ}$ . It is often assumed that  $g_{LQ}^2/4\pi=1/137$ . Limits shown are for a scalar, weak isoscalar, charge  $-1/3$  leptoquark.

- 171 AKTAS 05B limit is for a scalar, weak isoscalar, charge  $-1/3$  leptoquark coupled with  $e_R$ . See their Fig. 3 for limits on states with different quantum numbers.
- 172 CHEKANOV 05 search for various leptoquarks with lepton-flavor violating couplings. See their Figs.6–10 and Tables 1–8 for detailed limits.
- 173 CHEKANOV 03B limit is for a scalar, weak isoscalar, charge  $-1/3$  leptoquark coupled with  $e_R$ . See their Figs. 11–12 and Table 5 for limits on states with different quantum numbers.
- 174 For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 4 and Fig. 5.
- 175 CHEKANOV 02 search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 6–7 and Tables 5–6 for detailed limits.
- 176 For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 3.
- 177 See their Fig. 14 for limits in the mass-coupling plane.
- 178 BREITWEG 00E search for  $F=0$  leptoquarks in  $e^+ p$  collisions. For limits in mass-coupling plane, see their Fig. 11.

- 179 ABREU 99G limit obtained from process  $e\gamma \rightarrow LQ+q$ . For limits on vector and scalar states with different quantum numbers and the limits in the coupling-mass plane, see their Fig. 4 and Table 2.
- 180 For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 13 and Fig. 14. ADLOFF 99 also search for leptoquarks with lepton-flavor violating couplings. ADLOFF 99 supersedes AID 96B.
- 181 DERRICK 97 search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 5–8 and Table 1 for detailed limits.
- 182 Limit from single production in Z decay. The limit is for a leptoquark coupling of electromagnetic strength and assumes  $B(\ell q) = 2/3$ . The limit is 77 GeV if first and second leptoquarks are degenerate.
- 183 DERRICK 93 search for single leptoquark production in  $ep$  collisions with the decay  $eq$  and  $\nu q$ . The limit is for leptoquark coupling of electromagnetic strength and assumes  $B(eq) = B(\nu q) = 1/2$ . The limit for  $B(eq) = 1$  is 176 GeV. For limits on states with different quantum numbers, see their Table 3.

- 184 CHEKANOV 05 search for various leptoquarks with lepton-flavor violating couplings. See their Figs.6–10 and Tables 1–8 for detailed limits.
- 185 ADLOFF 03 limit is for the weak isotriplet spin-0 leptoquark at strong coupling  $\lambda=\sqrt{4\pi}$ . For the limits of leptoquarks with different quantum numbers, see their Table 3. Limits are derived from bounds on  $e^\pm q$  contact interactions.
- 186 The bound is derived from  $B(B^0 \rightarrow e^\pm \mu^\mp) < 1.7 \times 10^{-7}$ .
- 187 CHEKANOV 02 search for lepton-flavor violation in  $ep$  collisions. See their Tables 1–4 for limits on lepton-flavor violating and four-fermion interactions induced by various leptoquarks.
- 188 CHEUNG 01B quoted limit is for a scalar, weak isoscalar, charge  $-1/3$  leptoquark with a coupling of electromagnetic strength. The limit is derived from bounds on contact interactions in a global electroweak analysis. For the limits of leptoquarks with different quantum numbers, see Table 5.
- 189 ACCIARRI 00P limit is for the weak isoscalar spin-0 leptoquark with the coupling of electromagnetic strength. For the limits of leptoquarks with different quantum numbers, see their Table 4.
- 190 ADLOFF 00 limit is for the weak isotriplet spin-0 leptoquark at strong coupling,  $\lambda=\sqrt{4\pi}$ . For the limits of leptoquarks with different quantum numbers, see their Table 2. ADLOFF 00 limits are from the  $Q^2$  spectrum measurement of  $e^+ p \rightarrow e^+ X$ .
- 191 BARATE 00I search for deviations in cross section and jet-charge asymmetry in  $e^+ e^- \rightarrow \bar{q}q$  due to  $t$ -channel exchange of a leptoquark at  $\sqrt{s}=130$  to 183 GeV. Limits for other scalar and vector leptoquarks are also given in their Table 22.
- 192 BARGER 00 explain the deviation of atomic parity violation in cesium atoms from prediction is explained by scalar leptoquark exchange.
- 193 GABRIELLI 00 calculate various process with lepton flavor violation in leptoquark models.
- 194 ZARNECKI 00 limit is derived from data of HERA, LEP, and Tevatron and from various low-energy data including atomic parity violation. Leptoquark coupling with electromagnetic strength is assumed.
- 195 ABBIENDI 99 limits are from  $e^+ e^- \rightarrow q\bar{q}$  cross section at 130–136, 161–172, 183 GeV. See their Fig. 8 and Fig. 9 for limits in mass-coupling plane.
- 196 ABE 98V quoted limit is from  $B(B_s \rightarrow e^\pm \mu^\mp) < 8.2 \times 10^{-6}$ . ABE 98V also obtain a similar limit on  $M_{LQ} > 20.4$  TeV from  $B(B_d \rightarrow e^\pm \mu^\mp) < 4.5 \times 10^{-6}$ . Both bounds assume the non-canonical association of the  $b$  quark with electrons or muons under SU(4).
- 197 ACCIARRI 98J limit is from  $e^+ e^- \rightarrow q\bar{q}$  cross section at  $\sqrt{s}=130$ –172 GeV which can be affected by the  $t$ - and  $u$ -channel exchanges of leptoquarks. See their Fig. 4 and Fig. 5 for limits in the mass-coupling plane.
- 198 ACKERSTAFF 98V limits are from  $e^+ e^- \rightarrow q\bar{q}$  and  $e^+ e^- \rightarrow b\bar{b}$  cross sections at  $\sqrt{s}=130$ –172 GeV, which can be affected by the  $t$ - and  $u$ -channel exchanges of leptoquarks. See their Fig. 21 and Fig. 22 for limits of leptoquarks in mass-coupling plane.
- 199 DEANDREA 97 limit is for  $\tilde{R}_2$  leptoquark obtained from atomic parity violation (APV). The coupling of leptoquark is assumed to be electromagnetic strength. See Table 2 for limits of the four-fermion interactions induced by various scalar leptoquark exchange. DEANDREA 97 combines APV limit and limits from Tevatron and HERA. See Fig. 1–4 for combined limits of leptoquark in mass-coupling plane.
- 200 DERRICK 97 search for lepton-flavor violation in  $ep$  collision. See their Tables 2–5 for limits on lepton-flavor violating four-fermion interactions induced by various leptoquarks.
- 201 GROSSMAN 97 estimate the upper bounds on the branching fraction  $B \rightarrow \tau^+ \tau^- (X)$  from the absence of the  $B$  decay with large missing energy. These bounds can be used to constrain leptoquark induced four-fermion interactions.
- 202 JADACH 97 limit is from  $e^+ e^- \rightarrow q\bar{q}$  cross section at  $\sqrt{s}=172.3$  GeV which can be affected by the  $t$ - and  $u$ -channel exchanges of leptoquarks. See their Fig. 1 for limits on vector leptoquarks in mass-coupling plane.
- 203 KUZNETSOV 95B use  $\pi$ ,  $K$ ,  $B$ ,  $\tau$  decays and  $\mu e$  conversion and give a list of bounds on the leptoquark mass and the fermion mixing matrix in the Pati-Salam model. The quoted limit is from  $K_L \rightarrow \mu e$  decay assuming zero mixing.

- 204 MIZUKOSHI 95 calculate the one-loop radiative correction to the Z-physics parameters in various scalar leptoquark models. See their Fig. 4 for the exclusion plot of third generation leptoquark models in mass-coupling plane.
- 205 BHATTACHARYYA 94 limit is from one-loop radiative correction to the leptonic decay width of the Z.  $m_H=250$  GeV,  $\alpha_s(m_Z)=0.12$ ,  $m_t=180$  GeV, and the electroweak strength of leptoquark coupling are assumed. For leptoquark coupled to  $\bar{e}_L t_R$ ,  $\bar{\mu} t$ , and  $\bar{\tau} t$ , see Fig. 2 in BHATTACHARYYA 94B erratum and Fig. 3.
- 206 DAVIDSON 94 gives an extensive list of the bounds on leptoquark-induced four-fermion interactions from  $\pi$ ,  $K$ ,  $D$ ,  $B$ ,  $\mu$ ,  $\tau$  decays and meson mixings, *etc.* See Table 15 of DAVIDSON 94 for detail.
- 207 KUZNETSOV 94 gives mixing independent bound of the Pati-Salam leptoquark from the cosmological limit on  $\pi^0 \rightarrow \bar{\nu}\nu$ .
- 208 LEURER 94, LEURER 94B limits are obtained from atomic parity violation and apply to any chiral leptoquark which couples to the first generation with electromagnetic strength. For a nonchiral leptoquark, universality in  $\pi_{\ell 2}$  decay provides a much more stringent bound.
- 209 MAHANTA 94 gives bounds of  $P$ - and  $T$ -violating scalar-leptoquark couplings from atomic and molecular experiments.
- 210 From  $(\pi \rightarrow e\nu)/(\pi \rightarrow \mu\nu)$  ratio. SHANKER 82 assumes the leptoquark induced four-fermion coupling  $4g^2/M^2 (\bar{\nu}_{eL} u_R) (\bar{d}_L e_R)$  with  $g=0.004$  for spin-0 leptoquark and  $g^2/M^2 (\bar{\nu}_{eL} \gamma_\mu u_L) (\bar{d}_R \gamma^\mu e_R)$  with  $g \simeq 0.6$  for spin-1 leptoquark.

### MASS LIMITS for Diquarks

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
none 290–420	95	211 ABE	97G CDF	$E_6$ diquark
none 15–31.7	95	212 ABREU	940 DLPH	SUSY $E_6$ diquark
211 ABE 97G search for new particle decaying to dijets.				
212 ABREU 940 limit is from $e^+ e^- \rightarrow \bar{c} \bar{s} c s$ . Range extends up to 43 GeV if diquarks are degenerate in mass.				

### MASS LIMITS for $g_A$ (axigluon)

Axigluons are massive color-octet gauge bosons in chiral color models and have axial-vector coupling to quarks with the same coupling strength as gluons.

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
>365	95	213 DONCHESKI	98 RVUE	$\Gamma(Z \rightarrow \text{hadron})$

- 213 DONCHESKI 98 compare  $\alpha_s$  derived from low-energy data and that from  $\Gamma(Z \rightarrow \text{hadrons})/\Gamma(Z \rightarrow \text{leptons})$ .
- 214 ABE 97G search for new particle decaying to dijets.
- 215 ABE 95N assume axigluons decaying to quarks in the Standard Model only.
- 216 ABE 93G assume  $\Gamma(g_A) = N\alpha_s m_{g_A}/6$  with  $N = 10$ .
- 217 CUYPERS 91 compare  $\alpha_s$  measured in  $\Upsilon$  decay and that from  $R$  at PEP/PETRA energies.
- 218 ABE 90H assumes  $\Gamma(g_A) = N\alpha_s m_{g_A}/6$  with  $N = 5$  ( $\Gamma(g_A) = 0.09m_{g_A}$ ). For  $N = 10$ , the excluded region is reduced to 120–150 GeV.
- 219 ROBINETT 89 result demands partial-wave unitarity of  $J = 0$   $t\bar{t} \rightarrow t\bar{t}$  scattering amplitude and derives a limit  $m_{g_A} > 0.5 m_t$ . Assumes  $m_t > 56$  GeV.
- 220 ALBAJAR 88B result is from the nonobservation of a peak in two-jet invariant mass distribution.  $\Gamma(g_A) < 0.4 m_{g_A}$  assumed. See also BAGGER 88.
- 221 CUYPERS 88 requires  $\Gamma(\Upsilon \rightarrow g g_A) < \Gamma(\Upsilon \rightarrow g g g)$ . A similar result is obtained by DONCHESKI 88.
- 222 DONCHESKI 88B requires  $\Gamma(\Upsilon \rightarrow g q\bar{q})/\Gamma(\Upsilon \rightarrow g g g) < 0.25$ , where the former decay proceeds via axigluon exchange. A more conservative estimate of  $< 0.5$  leads to  $m_{g_A} > 21$  GeV.

## $X^0$ (Heavy Boson) Searches in $Z$ Decays

Searches for radiative transition of  $Z$  to a lighter spin-0 state  $X^0$  decaying to hadrons, a lepton pair, a photon pair, or invisible particles as shown in the comments. The limits are for the product of branching ratios.

223 BARATE 98U obtain limits on $B(Z \rightarrow \gamma X^0)B(X^0 \rightarrow \ell\bar{\ell}, q\bar{q}, gg, \gamma\gamma, \nu\bar{\nu})$ . See their Fig. 17.				
224 See Fig. 4 of ACCIARRI 97Q for the upper limit on $B(Z \rightarrow \gamma X^0; E_\gamma > E_{\min})$ as a function of $E_{\min}$ .				
225 ACTON 93E give $\sigma(e^+e^- \rightarrow X^0\gamma) \cdot B(X^0 \rightarrow \gamma\gamma) < 0.4$ pb (95%CL) for $m_{X^0} = 60 \pm 2.5$ GeV. If the process occurs via $s$ -channel $\gamma$ exchange, the limit translates to $\Gamma(X^0) \cdot B(X^0 \rightarrow \gamma\gamma)^2 < 20$ MeV for $m_{X^0} = 60 \pm 1$ GeV.				
226 ABREU 92D give $\sigma_Z \cdot B(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \text{hadrons}) < (3-10)$ pb for $m_{X^0} = 10-78$ GeV. A very similar limit is obtained for spin-1 $X^0$ .				

- 227 ADRIANI 92F search for isolated  $\gamma$  in hadronic  $Z$  decays. The limit  $\sigma_Z \cdot B(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \text{hadrons}) < (2-10)$  pb (95%CL) is given for  $m_{X^0} = 25-85$  GeV.
- 228 ACTON 91 searches for  $Z \rightarrow Z^* X^0$ ,  $Z^* \rightarrow e^+ e^-, \mu^+ \mu^-,$  or  $\nu \bar{\nu}$ . Excludes any new scalar  $X^0$  with  $m_{X^0} < 9.5$  GeV/ $c$  if it has the same coupling to  $Z Z^*$  as the MSM Higgs boson.
- 229 ACTON 91B limits are for  $m_{X^0} = 60-85$  GeV.
- 230 ADEVA 91D limits are for  $m_{X^0} = 30-89$  GeV.
- 231 ADEVA 91D limits are for  $m_{X^0} = 30-86$  GeV.
- 232 AKRAWY 90J give  $\Gamma(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \text{hadrons}) < 1.9$  MeV (95%CL) for  $m_{X^0} = 32-80$  GeV. We divide by  $\Gamma(Z) = 2.5$  GeV to get product of branching ratios. For nonresonant transitions, the limit is  $B(Z \rightarrow \gamma q \bar{q}) < 8.2$  MeV assuming three-body phase space distribution.

### MASS LIMITS for a Heavy Neutral Boson Coupling to $e^+ e^-$

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
none 55-61		233 ODAKA	89 VNS	$\Gamma(X^0 \rightarrow e^+ e^-) \cdot B(X^0 \rightarrow \text{hadrons}) \gtrsim 0.2$ MeV

>47.8	95	237 ADEVA	84 MRKJ	$\Gamma(X^0 \rightarrow e^+ e^-) = 4$ MeV
none 39.8-45.2		237 BEHREND	84C CELL	
>47	95	237 BEHREND	84C CELL	$\Gamma(X^0 \rightarrow e^+ e^-) = 4$ MeV

- 233 ODAKA 89 looked for a narrow or wide scalar resonance in  $e^+ e^- \rightarrow \text{hadrons}$  at  $E_{\text{cm}} = 55.0-60.8$  GeV.
- 234 DERRICK 86 found no deviation from the Standard Model Bhabha scattering at  $E_{\text{cm}} = 29$  GeV and set limits on the possible scalar boson  $e^+ e^-$  coupling. See their figure 4 for excluded region in the  $\Gamma(X^0 \rightarrow e^+ e^-) - m_{X^0}$  plane. Electronic chiral invariance requires a parity doublet of  $X^0$ , in which case the limit applies for  $\Gamma(X^0 \rightarrow e^+ e^-) = 3$  MeV.
- 235 ADEVA 85 first limit is from  $2\gamma, \mu^+ \mu^-,$  hadrons assuming  $X^0$  is a scalar. Second limit is from  $e^+ e^-$  channel.  $E_{\text{cm}} = 40-47$  GeV. Supersedes ADEVA 84.
- 236 BERGER 85B looked for effect of spin-0 boson exchange in  $e^+ e^- \rightarrow e^+ e^-$  and  $\mu^+ \mu^-$  at  $E_{\text{cm}} = 34.7$  GeV. See Fig. 5 for excluded region in the  $m_{X^0} - \Gamma(X^0)$  plane.
- 237 ADEVA 84 and BEHREND 84C have  $E_{\text{cm}} = 39.8-45.5$  GeV. MARK-J searched  $X^0$  in  $e^+ e^- \rightarrow \text{hadrons}, 2\gamma, \mu^+ \mu^-, e^+ e^-$  and CELLO in the same channels plus  $\tau$  pair. No narrow or broad  $X^0$  is found in the energy range. They also searched for the effect of  $X^0$  with  $m_{X^0} > E_{\text{cm}}$ . The second limits are from Bhabha data and for spin-0 singlet. The same limits apply for  $\Gamma(X^0 \rightarrow e^+ e^-) = 2$  MeV if  $X^0$  is a spin-0 doublet. The second limit of BEHREND 84C was read off from their figure 2. The original papers also list limits in other channels.

### Search for $X^0$ Resonance in $e^+e^-$ Collisions

The limit is for  $\Gamma(X^0 \rightarrow e^+e^-) \cdot B(X^0 \rightarrow f)$ , where  $f$  is the specified final state.

Spin 0 is assumed for  $X^0$ .
