⁴ The reported result is $m_{B_s^0} - m_{B^0} = 86.38 \pm 0.90 \pm 0.06$ MeV. We convert it to the mass difference with respect to the average of $(m_{B^\pm} + m_{B^0})/2$.				

$$m_{B_{sH}^0} - m_{B_{sL}^0}$$

See the $B_s^0\text{-}\bar{B}_s^0$ MIXING section near the end of these B_s^0 Listings.

B_s^0 MEAN LIFE

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at <http://www.slac.stanford.edu/xorg/hfag/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

The First "OUR EVALUATION" is an average of $1 / [0.5 (\Gamma_{B_{sL}^0} + \Gamma_{B_{sH}^0})]$.

The Second "OUR EVALUATION" is the average of $B_s \rightarrow D_s X$ data listed below.

WEIGHTED AVERAGE
 $1.45 \pm 0.14 \mp 0.12$ (Error scaled by 1.5)

$\Delta\Gamma_{B_s^0}/\Gamma_{B_s^0}$

$\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ are the decay rate average and difference between two B_s^0 CP eigenstates (light – heavy).

“OUR EVALUATION” is an average of all available B_s semi-leptonic lifetime measurements with the $\Delta\Gamma_{B_s^0}/\Gamma_{B_s^0}$ analyses performed by the Heavy Flavor Averaging Group (HFAG) as described in our “Review on $B-\bar{B}$ Mixing” in the B^0 Section of these Listings. The corresponding 95% CL is $-0.052 < \Delta\Gamma_{B_s^0}/\Gamma_{B_s^0} < 0.18$.

1.52 ± 0.04 ± 0.02	⁴¹ AALTONEN	08J CDF	$p\bar{p}$ at 1.96 TeV
⁴¹ Measured using the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi\phi$ decays.			

B_s^0 DECAY MODES

These branching fractions all scale with $B(\bar{b} \rightarrow B_s^0)$, the LEP B_s^0 production fraction. The first four were evaluated using $B(\bar{b} \rightarrow B_s^0) = (10.7 \pm 1.2)\%$ and the rest assume $B(\bar{b} \rightarrow B_s^0) = 12\%$.

The branching fraction $B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$ is not a pure measurement since the measured product branching fraction $B(\bar{b} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$ was used to determine $B(\bar{b} \rightarrow B_s^0)$, as described in the note on “ B^0 - \bar{B}^0 Mixing”

For inclusive branching fractions, e.g., $B \rightarrow D^\pm \text{ anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level

<u>VALUE</u>	<u>EVTS</u>	<u>DOCUMENT ID</u>	<u>TECN</u>	<u>COMMENT</u>
0.93±0.25 OUR AVERAGE				
0.91±0.18±0.41		42 DRUTSKOY	07 BELL	$e^+ e^- \rightarrow \gamma(4S)$
0.81±0.24±0.22	90	43 BUSKULIC	96E ALEP	$e^+ e^- \rightarrow Z$
1.56±0.58±0.44	147	44 ACTON	92N OPAL	$e^+ e^- \rightarrow Z$

⁴² The extraction of this result takes into account the correlation between the measurements of $B(\Upsilon(5S) \rightarrow D_s X)$ and $B(\Upsilon(5S) \rightarrow D^0 X)$.

⁴³ BUSKULIC 96E separate $c\bar{c}$ and $b\bar{b}$ sources of D_s^+ mesons using a lifetime tag, subtract generic $\bar{b} \rightarrow W^+ \rightarrow D_s^+$ events, and obtain $B(\bar{b} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \text{ anything}) = 0.088 \pm 0.020 \pm 0.020$ assuming $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to other D_s channels. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.

⁴⁴ ACTON 92N assume that excess of $147 \pm 48 D_S^0$ events over that expected from B^0 , B^+ , and $c\bar{c}$ is all from B_S^0 decay. The product branching fraction is measured to be $B(\bar{b} \rightarrow B_S^0)B(B_S^0 \rightarrow D_S^- \text{ anything}) \times B(D_S^- \rightarrow \phi\pi^-) = (5.9 \pm 1.9 \pm 1.1) \times 10^{-3}$. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$.

$\Gamma(D_S^- \ell^+ \nu_\ell \text{ anything})/\Gamma_{\text{total}}$

Γ_2/Γ

The values and averages in this section serve only to show what values result if one assumes our $B(\bar{b} \rightarrow B_S^0)$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(\bar{b} \rightarrow B_S^0)$ as described in the note on "Production and Decay of b -Flavored Hadrons."

● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
0.13 ±0.04 ±0.04	27	⁴⁸ BUSKULIC	92E ALEP	$e^+e^- \rightarrow Z$

⁴⁵ BUSKULIC 95O use $D_S \ell$ correlations. The measured product branching ratio is $B(\bar{b} \rightarrow B_S) \times B(B_S \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything}) = (0.82 \pm 0.09^{+0.13}_{-0.14})\%$ assuming $B(D_S \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to the six other D_S channels used in this analysis. Combined with results from $\mathcal{T}(4S)$ experiments this can be used to extract $B(\bar{b} \rightarrow B_S) = (11.0 \pm 1.2^{+2.5}_{-2.6})\%$. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$.

⁴⁶ ABREU 92M measured muons only and obtained product branching ratio $B(Z \rightarrow b \text{ or } \bar{b}) \times B(\bar{b} \rightarrow B_S) \times B(B_S \rightarrow D_S \mu^+ \nu_\mu \text{ anything}) \times B(D_S \rightarrow \phi\pi) = (18 \pm 8) \times 10^{-5}$. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$. We use $B(Z \rightarrow b \text{ or } \bar{b}) = 2B(Z \rightarrow b\bar{b}) = 2 \times (0.2212 \pm 0.0019)$.

⁴⁷ ACTON 92N is measured using $D_S \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. The product branching fraction measured is measured to be $B(\bar{b} \rightarrow B_S^0)B(B_S^0 \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything}) \times B(D_S^- \rightarrow \phi\pi^-) = (3.9 \pm 1.1 \pm 0.8) \times 10^{-4}$. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$.

⁴⁸ BUSKULIC 92E is measured using $D_S \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. They use $2.7 \pm 0.7\%$ for the $\phi\pi^+$ branching fraction. The average product branching fraction is measured to be $B(\bar{b} \rightarrow B_S^0)B(B_S^0 \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything}) = 0.020 \pm 0.0055^{+0.005}_{-0.006}$. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$. Superseded by BUSKULIC 95O.

B_s^0 - \bar{B}_s^0 MIXING

For a discussion of B_s^0 - \bar{B}_s^0 mixing see the note on “ B^0 - \bar{B}^0 Mixing” in the B^0 Particle Listings above.

χ_s is a measure of the time-integrated B_s^0 - \bar{B}_s^0 mixing probability that produced B_s^0 (\bar{B}_s^0) decays as a \bar{B}_s^0 (B_s^0). Mixing violates $\Delta B \neq 2$ rule.

$$\chi_s = \frac{x_s^2}{2(1+x_s^2)}$$

$$\chi_s = \frac{\Delta m_{B^0}}{\Gamma_{B_s^0}} = (m_{B_{sH}^0} - m_{B_{sL}^0}) \tau_{B_s^0},$$

where H, L stand for heavy and light states of two B_s^0 CP eigenstates and

$$\tau_{B_s^0} = \frac{1}{0.5(\Gamma_{B_{sH}^0} + \Gamma_{B_{sL}^0})}.$$

$$\Delta m_{B_s^0} = m_{B_{sH}^0} - m_{B_{sL}^0}$$

$\Delta m_{B_s^0}$ is a measure of 2π times the $B_s^0-\bar{B}_s^0$ oscillation frequency in time-dependent mixing experiments.

102 Significance of oscillation signal is 5.4σ . Also reports $|V_{td} / V_{ts}| = 0.2060 \pm 0.0007^{+0.0081}_{-0.0060}$.

103 A likelihood scan over the oscillation frequency, Δm_s , gives a most probable value of 19 ps^{-1} and a range of $17 < \Delta m_s < 21 \text{ (ps}^{-1})$ at 90% C.L. assuming Gaussian uncertainties. Also excludes $\Delta m_s < 14.8 \text{ ps}^{-1}$ at 95% C.L.

104 Significance of oscillation signal is 0.2%. Also reported the value $|V_{td} / V_{ts}| = 0.208^{+0.001+0.008}_{-0.002-0.006}$.

105 Uses leptons emitted with large momentum transverse to a jet and improved techniques for vertexing and flavor-tagging.

106 Updates of D_s -lepton analysis.

107 Combined results from all Delphi analyses.

108 Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.

109 ABE 03 uses the novel “charge dipole” technique to reconstruct separate secondary and tertiary vertices originating from the $B \rightarrow D$ decay chain. The analysis excludes $\Delta m_s < 4.9 \text{ ps}^{-1}$ and $7.9 < \Delta m_s < 10.3 \text{ ps}^{-1}$.

- 110 Three analyses based on complementary event selections: (1) fully-reconstructed hadronic decays; (2) semileptonic decays with D_s exclusively reconstructed; (3) inclusive semileptonic decays.
- 111 ABE 02V uses exclusively reconstructed D_s^- mesons and excludes $\Delta m_s < 1.4 \text{ ps}^{-1}$ and $2.4 < \Delta m_s < 5.3 \text{ ps}^{-1}$ at 95%CL.
- 112 Uses fully or partially reconstructed $D_s \ell$ vertices and a mixing tag as a flavor tagging.
- 113 Replaced by ABDALLAH 04A. Uses $D_s^- \ell^+$, and $\phi \ell^+$ vertices, and a multi-variable discriminant as a flavor tagging.
- 114 Uses inclusive D_s vertices and fully reconstructed B_s decays and a multi-variable discriminant as a flavor tagging.
- 115 Uses ℓ - Q_{hem} and ℓ - ℓ .
- 116 ABE 99D assumes $\tau_{B_s^0} = 1.55 \pm 0.05 \text{ ps}$ and $\Delta\Gamma/\Delta m = (5.6 \pm 2.6) \times 10^{-3}$.
- 117 ABE 99J uses ϕ ℓ - ℓ correlation.
- 118 BARATE 99J uses combination of an inclusive lepton and D_s^- -based analyses.
- 119 BARATE 98C combines results from $D_s h$ - ℓ/Q_{hem} , $D_s h$ - K in the same side, $D_s \ell$ - ℓ/Q_{hem} and $D_s \ell$ - K in the same side.
- 120 Uses ℓ - Q_{hem} .
- 121 Uses ℓ - ℓ .
- 122 ADAM 97 combines results from $D_s \ell$ - Q_{hem} , ℓ - Q_{hem} , and ℓ - ℓ .
- 123 BUSKULIC 96M uses D_s lepton correlations and lepton, kaon, and jet charge tags.
- 124 BUSKULIC 95J uses ℓ - Q_{hem} . They find $\Delta m_s > 5.6$ [> 6.1] for $f_s=10\%$ [12%]. We interpolate to our central value $f_s=10.5\%$.

$$x_s = \Delta m_{B_s^0} / \Gamma_{B_s^0}$$

This is derived by the Heavy Flavor Averaging Group (HFAG) from the results on $\Delta m_{B_s^0}$ and "OUR EVALUATION" of the B_s^0 mean lifetime.
