B^0

$$I(J^P) = \tfrac{1}{2}(0^-)$$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the $B^\pm/B^0$ ADMIXTURE and $B^\pm/B^0/B_s^0/b$-baryon ADMIXTURE sections.

See the Note "Production and Decay of b-flavored Hadrons" at the beginning of the $B^\pm$ Particle Listings and the Note on "B^0-$\overline{B}^0$ Mixing" near the end of the B^0 Particle Listings.

B^0 MASS

The fit uses m_{B^+}, $(m_{B^0} - m_{B^+})$, and m_{B^0} to determine m_{B^+}, m_{B^0}, and the mass difference.

[1] Measured mean life using $B^0\to J/\psi K^{*0}$ decays.

[2] Measured mean life using $B^0\to J/\psi K_s$ decays.

[3] Measured using a simultaneous fit of the B^0 lifetime and $\overline{B}^0 B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0\to D^{*-}\ell\nu$ decays.

[4] Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.

[5] Measured using the time-dependent angular analysis of $B^0_d\to J/\psi K^{*0}$ decays.

[6] Measurement performed using an inclusive reconstruction and B flavor identification technique.

[7] Measurement performed with decays $B^0\to D^{*-}\pi^+$ and $B^0\to D^{*-}\rho^+$ using a partial reconstruction technique.

[8] Measured mean life using fully reconstructed decays.

[9] Data analyzed using partially reconstructed $\overline{B}^0\to D^{*+}\ell^-\overline{\nu}$ decays.

[10] Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.

[11] Data analyzed using $D/D^*\ell$X event vertices.

[12] Data analyzed using charge of secondary vertex.

[13] Data analyzed using inclusive $D/D^*\ell X$.

[14] Measured mean life using partially reconstructed $D^{*-}\pi^+$X vertices.

[15] ABREU 95Q assumes B($B^0\to D^{**-}\ell^+\nu_\ell$) = 3.2 ± 1.7%.

[16] Data analyzed using vertex-charge technique to tag B charge.

[17] AKERS 95T assumes B($B^0\to D_s^{(*)}D^{0(*)}$) = 5.0 ± 0.9% to find B^+/B^0 yield.

[18] AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0\to D^*(2010)^-\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.

[19] Combined result of $D/D^*\ell$x analysis, fully reconstructed B analysis, and partially reconstructed $D^{*-}\pi^+$X analysis.

[20] Combined ABREU 95Q and ADAM 95 result.

[21] WAGNER 90 tagged B^0 mesons by their decays into $D^{*-}e^+\nu$ and $D^{*-}\mu^+\nu$ where the D^{*-} is tagged by its decay into $\pi^-\overline{D}^0$.

[22] AVERILL 89 is an estimate of the B^0 mean lifetime assuming that $B^0 \to D^{*+} + X$ always.

MEAN LIFE RATIO τ_{B^+}/τ_{B^0}

τ_{B^+}/τ_{B^0} (direct measurements)

[1] Data analyzed using $D/D^* \mu$X vertices.

[2] Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.

[3] Measurement performed using an inclusive reconstruction and *B* flavor identification technique.

[4] Measured using fully reconstructed decays.

[5] Events are selected in which one *B* meson is fully reconstructed while the second *B* meson is reconstructed inclusively.

[6] Data analyzed using charge of secondary vertex.

[7] ABREU 95Q assumes B($B^0 \rightarrow D^{**-}\ell^+\nu_\ell$) = 3.2 ± 1.7%.

[8] Data analyzed using vertex-charge technique to tag *B* charge.

[9] AKERS 95T assumes B($B^0 \rightarrow D_s^{(*)}D^{0(*)}$) = 5.0 ± 0.9% to find B^+/B^0 yield.

[10] Combined result of $D/D^*\ell$X analysis and fully reconstructed *B* analysis.

τ_{B^+}/τ_{B^0} (inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for B^0 and B^+. We do not use measurements which assume equal production of B^0 and B^+ because of the large uncertainty in the production ratio.

• • • We do not use the following data for averages, fits, limits, etc. • • •				
<0.80	95	[2,3] BEHRENS 00B	CLE2	$e^+ e^- \to \Upsilon(4S)$

[1] Using the measured $\tau_{B^0} = 1.55 \pm 0.03$ ps.

[2] BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\overline{B}{}^0 \to D^{*+}\pi^-, \rho^-$ decays to determine the flavor of the B meson.

[3] Assumes $\Delta_{md} = 0.478 \pm 0.018$ ps^{-1} and $\tau_{B^0} = 1.548 \pm 0.032$ ps.

B^0 DECAY MODES

$\overline{B}{}^0$ modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the $B^\pm/B^0$ ADMIXTURE section.

The branching fractions listed below assume 50% $B^0 \overline{B}{}^0$ and 50% $B^+ B^-$ production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, D_s, D^*, and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, *e.g.,* $B \to D^{\pm}$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

[a] An ℓ indicates an e or a μ mode, not a sum over these modes.

[b] $\overline{D}^{**}$ represents an excited state with mass $2.2 < M < 2.8$ GeV/c^2.

[c] $X(3872)^+$ is a hypothetical charged partner of the $X(3872)$.

[d] Stands for the possible candidates of $K^*(1410)$, $K_0^*(1430)$ and $K_2^*(1430)$.

[e] B^0 and B_s^0 contributions not separated. Limit is on weighted average of the two decay rates.

[f] This decay refers to the coherent sum of resonant and nonresonant $J^P = 0^+$ $K\pi$ components with $1.60 < m_{K\pi} < 2.15$ GeV/c^2.

[g] The value is for the sum of the charge states or particle/antiparticle states indicated.

[h] $\Theta(1540)^+$ denotes a possible narrow pentaquark state.

B^0 BRANCHING RATIOS

For branching ratios in which the charge of the decaying B is not determined, see the $B^\pm$ section.

$\Gamma(\ell^+ \nu_\ell \, \text{anything})/\Gamma_{\text{total}}$ $\qquad\qquad$ Γ_1/Γ

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements.

$10.32\pm0.36\pm0.35$	[4] OKABE	05	BELL	Repl. by URQUIJO 07
$10.9\ \pm0.7\ \pm1.1$	ATHANAS	94	CLE2	Sup. by ARTUSO 97

[1] URQUIJO 07 report a measurement of $(9.80 \pm 0.29 \pm 0.21)\%$ for the partial branching fraction of $B \to e\nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B \to e\nu_e X$ branching fraction.

[2] The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: B($B^+ \to e^+\nu_e X$) / B($B^0 \to e^+\nu_e X$) = $1.074 \pm 0.041 \pm 0.026$.

[3] ARTUSO 97 uses partial reconstruction of $B \to D^*\ell\nu_\ell$ and inclusive semileptonic branching ratio from BARISH 96B ($0.1049 \pm 0.0017 \pm 0.0043$).

[4] The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame, and their ratio of B($B^+ \to e^+\nu_e X$)/B($B^0 \to e^+\nu_e X$) = $1.08 \pm 0.05 \pm 0.02$.

$\Gamma(e^+ \nu_e X_c)/\Gamma_{\text{total}}$ $\qquad\qquad$ Γ_2/Γ

VALUE (units 10^{-2})	DOCUMENT ID		TECN	COMMENT
10.08±0.30±0.22	[1] URQUIJO	07	BELL	$e^+e^- \to \Upsilon(4S)$

[1] Measure the independent B^+ and B^0 partial branching fractions with electron threshold energies of 0.4 GeV.

$\Gamma(D^- \ell^+ \nu_\ell)/\Gamma_{\text{total}}$ $\qquad\qquad$ Γ_4/Γ

ℓ denotes e or μ, not the sum.

"OUR EVALUATION" is an average using rescaled values of the data listed below. [1] Uses a fully reconstructed B meson as a tag on the recoil side.

[2] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[3] BUSKULIC 97 assumes fraction (B^+) = fraction (B^0) = (37.8 ± 2.2)% and PDG 96 values for B lifetime and branching ratio of D^* and D decays.

[4] ATHANAS 97 uses missing energy and missing momentum to reconstruct neutrino.

[5] FULTON 91 assumes assuming equal production of B^0 and B^+ at the $\Upsilon(4S)$ and uses Mark III D and D^* branching ratios.

[6] ALBRECHT 89J reports $0.018 \pm 0.006 \pm 0.005$. We rescale using the method described in STONE 94 but with the updated PDG 94 B($D^0 \to K^-\pi^+$).

[1] Uses a fully reconstructed B meson as a tag on the recoil side.

[2] Measured using fully reconstructed D^* sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.

[3] Measured using fully reconstructed D^* sample.

[4] Uses the combined fit of both $B^0 \to D^*(2010)^-\ell\nu$ and $B^+ \to \overline{D}(2007)^0\ell\nu$ samples.

[5] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[6] ABREU 01H measured using about 5000 partial reconstructed D^* sample.

[7] ABBIENDI 00Q assumes the fraction B$(b \to B^0) = (39.7{}^{+1.8}_{-2.2})\%$. This result is an average of two methods using exclusive and partial D^* reconstruction.

[8] BUSKULIC 97 assumes fraction (B^+) = fraction $(B^0) = (37.8 \pm 2.2)\%$ and PDG 96 values for B lifetime and D^* and D branching fractions.

[9] Combines with previous partial reconstructed D^* measurement.

[10] The results are based on the same analysis and data sample reported in ADAM 03.

[11] ACKERSTAFF 97G assumes fraction (B^+) = fraction $(B^0) = (37.8 \pm 2.2)\%$ and PDG 96 values for B lifetime and branching ratio of D^* and D decays.

[12] ABREU 96P result is the average of two methods using exclusive and partial D^* reconstruction.

[13] BARISH 95 use B$(D^0 \to K^-\pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$ and B$(D^{*+} \to D^0\pi^+) = (68.1 \pm 1.0 \pm 1.3)\%$.

[14] BUSKULIC 95N assumes fraction (B^+) = fraction $(B^0) = 38.2 \pm 1.3 \pm 2.2\%$ and $\tau_{B^0} = 1.58 \pm 0.06$ ps. $\Gamma(D^{*-}\ell^+\nu_\ell)/\text{total} = [5.18 - 0.13(\text{fraction}(B^0) - 38.2) - 1.5(\tau_{B^0} - 1.58)]\%$.

[15] ALBRECHT 94 assumes B$(D^{*+} \to D^0\pi^+) = 68.1 \pm 1.0 \pm 1.3\%$. Uses partial reconstruction of D^{*+} and is independent of D^0 branching ratios.

[16] ALBRECHT 93 reports $0.052 \pm 0.005 \pm 0.006$. We rescale using the method described in STONE 94 but with the updated PDG 94 B$(D^0 \to K^-\pi^+)$. We have taken their average e and μ value. They also obtain $\alpha = 2*\Gamma^0/(\Gamma^- + \Gamma^+) - 1 = 1.1 \pm 0.4 \pm 0.2$, $A_{AF} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.2 \pm 0.08 \pm 0.06$ and a value of $|V_{cb}| = 0.036$–0.045 depending on model assumptions.

[17] Combining $\overline{D}^{*0}\ell^+\nu_\ell$ and $\overline{D}^{*-}\ell^+\nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$.

Assuming a value of V_{cb}, they measure V, A_1, and A_2, the three form factors for the $D^* \ell \nu_\ell$ decay, where results are slightly dependent on model assumptions.

[18] ANTREASYAN 90B is average over B and $\overline{D}^*(2010)$ charge states.

[19] The measurement of ALBRECHT 89C suggests a D^* polarization γ_L/γ_T of 0.85 ± 0.45. or $\alpha = 0.7 \pm 0.9$.

[20] ALBRECHT 89J is ALBRECHT 87J value rescaled using $B(D^*(2010)^- \to D^0 \pi^-) = 0.57 \pm 0.04 \pm 0.04$. Superseded by ALBRECHT 93.

[21] We have taken average of the the BORTOLETTO 89B values for electrons and muons, $0.046 \pm 0.005 \pm 0.007$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \to K^- \pi^+)$. The measurement suggests a D^* polarization parameter value $\alpha = 0.65 \pm 0.66 \pm 0.25$.

[22] ALBRECHT 87J assume μ-e universality, the $B(\Upsilon(4S) \to B^0 \overline{B}^0) = 0.45$, the $B(D^0 \to K^- \pi^+) = (0.042 \pm 0.004 \pm 0.004)$, and the $B(D^*(2010)^- \to D^0 \pi^-) = 0.49 \pm 0.08$. Superseded by ALBRECHT 89J.

<4.1	90	[9] BEAN	93B	CLE2	$e^+e^- \to \Upsilon(4S)$

[1] The B^0 and B^+ results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the $\Upsilon(4S)$.

[2] The signal events are tagged by a second B meson reconstructed in the semileptonic mode $B \to D^{(*)}\ell\nu_\ell$.

[3] B^+ and B^0 decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

[4] ATHAR 03 reports systematic errors $^{+0.47}_{-0.50} \pm 0.41 \pm 0.01$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

[5] Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.

[6] Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors $^{+0.33}_{-0.46} \pm 0.41$, where the second error is theoretical model dependence. We combine these in quadrature.

[7] BEHRENS 00 reports $^{+0.35}_{-0.40} \pm 0.50$, where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0 \to \rho^-\ell^+\nu) = 2\Gamma(B^+ \to \rho^0\ell^+\nu) \approx 2\Gamma(B^+ \to \omega\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.

[8] ALEXANDER 96T reports $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0 \to \rho^-\ell^+\nu) = 2\Gamma(B^+ \to \rho^0\ell^+\nu) \approx 2\Gamma(B^+ \to \omega\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.

[9] BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine $\Gamma(\rho^0\ell^+\nu_\ell)$ and $\Gamma(\omega\ell^+\nu_\ell)$ with this result, they obtain a limit $< (1.6-2.7) \times 10^{-4}$ at 90% CL for $B^+ \to (\omega \text{ or } \rho^0)\ell^+\nu_\ell$. The range corresponds to the ISGW, WSB, and KS models. An upper limit on $|V_{ub}/V_{cb}| < 0.08-0.13$ at 90% CL is derived as well.

$\Gamma(\pi^-\ell^+\nu_\ell)/\Gamma_{\text{total}}$ $\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad$ Γ_{17}/Γ

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements.

[1] Using isospin relation, B^+ and B^0 branching fractions are combined.

[2] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[3] The B^0 and B^+ results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the $\Upsilon(4S)$.

[4] Also report the rate for $q^2 > 16$ GeV^2 of $(0.41 \pm 0.08 \pm 0.04) \times 10^{-4}$ from which they obtain $|V_{ub}| = 3.6 \pm 0.4 \pm 0.2^{+0.6}_{-0.4}$ (last error is from theory).

[5] The analysis uses events in which the signal B decays are reconstructed with an innovative loose neutrino reconstruction technique.

[6] The signal events are tagged by a second B meson reconstructed in the semileptonic mode $B \rightarrow D^{(*)} \ell \nu_\ell$.

[7] The signals are tagged by a second B meson reconstructed in a semileptonic or hadronic decay. The B^0 and B^+ results are combined assuming the isospin symmetry.

[8] B^+ and B^0 decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

[9] ATHAR 03 reports systematic errors $0.11 \pm 0.01 \pm 0.07$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

[10] ALEXANDER 96T gives systematic errors $\pm 0.3 \pm 0.2$ where the second error reflects the estimated model dependence. We combine these in quadrature. Assumes isospin symmetry: $\Gamma(B^0 \rightarrow \pi^- \ell^+ \nu) = 2 \times \Gamma(B^+ \rightarrow \pi^0 \ell^+ \nu)$.

$3.1\ \pm1.3\ \pm1.0$	7	[5]	ALBRECHT	88K	ARG	$e^+e^- \rightarrow \Upsilon(4S)$

[1] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[2] Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.

[3] AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of B^0 and B^+, which is not included here.

[4] BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D.

[5] ALBRECHT 88K assumes $B^0\overline{B}^0$:B^+B^- production ratio is 45:55. Superseded by ALBRECHT 90J which assumes 50:50.

[6] BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

[7] AUBERT,B 04O reports $[\Gamma(B^0 \rightarrow D^-\pi^+)/\Gamma_{total}] \times [B(D^+ \rightarrow K^0_S\pi^+)] = (42.7 \pm 2.1 \pm 2.2) \times 10^{-6}$. We divide by our best value $B(D^+ \rightarrow K^0_S\pi^+) = (1.46 \pm 0.04) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[8] ALAM 94 reports $[\Gamma(B^0 \rightarrow D^-\pi^+)/\Gamma_{total}] \times [B(D^+ \rightarrow K^-2\pi^+)] = (0.265 \pm 0.032 \pm 0.023) \times 10^{-3}$. We divide by our best value $B(D^+ \rightarrow K^-2\pi^+) = (9.29 \pm 0.25) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

< 70	90		[3] BORTOLETTO92		CLEO	$e^+ e^- \rightarrow \Upsilon(4S)$
<340	90		[4] BEBEK	87	CLEO	$e^+ e^- \rightarrow \Upsilon(4S)$
700 ± 500		5	[5] BEHRENDS	83	CLEO	$e^+ e^- \rightarrow \Upsilon(4S)$

[1] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[2] No assumption about the intermediate mechanism is made in the analysis.

[3] BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D. The product branching fraction into $D_0^*(2340)\pi$ followed by $D_0^*(2340) \rightarrow D^0 \pi$ is < 0.0001 at 90% CL and into $D_2^*(2460)$ followed by $D_2^*(2460) \rightarrow D^0 \pi$ is < 0.0004 at 90% CL.

[4] BEBEK 87 assume the $\Upsilon(4S)$ decays 43% to $B^0 \overline{B}{}^0$. We rescale to 50%. B($D^0 \rightarrow K^- \pi^+$) = $(4.2 \pm 0.4 \pm 0.4)$% and B($D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-$) = $(9.1 \pm 0.8 \pm 0.8)$% were used.

[5] Corrected by us using assumptions: B($D^0 \rightarrow K^- \pi^+$) = (0.042 ± 0.006) and B($\Upsilon(4S) \rightarrow B^0 \overline{B}{}^0$) = 50%. The product branching ratio is B($B^0 \rightarrow \overline{D}{}^0 \pi^+ \pi^-$)B($\overline{D}{}^0 \rightarrow K^+ \pi^-$) = $(0.39 \pm 0.26) \times 10^{-2}$.

17 ±5 ±5	41	[12] GILES	84	CLEO	$e^+ e^- \rightarrow \Upsilon(4S)$

[1] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[2] AUBERT,BE 06J reports $[\Gamma(B^0 \to D^*(2010)^- \pi^+)/\Gamma_{total}] / [B(B^0 \to D^- \pi^+)] = 0.99 \pm 0.11 \pm 0.08$. We multiply by our best value $B(B^0 \to D^- \pi^+) = (2.68 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.

[4] BRANDENBURG 98 assume equal production of B^+ and B^0 at $\Upsilon(4S)$ and use the D^* reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of $B(D^* \to D\pi)$.

[5] ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \to D^0 \pi^+)$ and absolute $B(D^0 \to K^- \pi^+)$ and the PDG 1992 $B(D^0 \to K^- \pi^+ \pi^0)/B(D^0 \to K^- \pi^+)$ and $B(D^0 \to K^- \pi^+ \pi^+ \pi^-)/B(D^0 \to K^- \pi^+)$.

[6] BORTOLETTO 92 reports $(4.0 \pm 1.0 \pm 0.7) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^- \pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \to D^0 \pi^+) = 0.57 \pm 0.06$. We rescale to our best value $B(D^*(2010)^+ \to D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D.

[7] ALBRECHT 90J reports $(2.8 \pm 0.9 \pm 0.6) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^- \pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \to D^0 \pi^+) = 0.57 \pm 0.06$. We rescale to our best value $B(D^*(2010)^+ \to D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D.

[8] BEBEK 87 reports $(2.8^{+1.5+1.0}_{-1.2-0.6}) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^- \pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \to D^0 \pi^+) = 0.57 \pm 0.06$. We rescale to our best value $B(D^*(2010)^+ \to D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92 and ALBRECHT 90J.

[9] Assumes $B(Z \to b\bar{b}) = 0.217$ and 38% B_d production fraction.

[10] ALBRECHT 87C use PDG 86 branching ratios for D and $D^*(2010)$ and assume $B(\Upsilon(4S) \to B^+ B^-) = 55\%$ and $B(\Upsilon(4S) \to B^0 \overline{B}^0) = 45\%$. Superseded by ALBRECHT 90J.

[11] ALBRECHT 86F uses pseudomass that is independent of D^0 and D^+ branching ratios.

[12] Assumes $B(D^*(2010)^+ \to D^0 \pi^+) = 0.60^{+0.08}_{-0.15}$. Assumes $B(\Upsilon(4S) \to B^0 \overline{B}^0) = 0.40 \pm 0.02$ Does not depend on D branching ratios.

0.081 ±0.029 $^{+0.059}_{-0.024}$	19	[6] CHEN 85	CLEO	$e^{+}e^{-}\rightarrow\Upsilon(4S)$

[1] Assumes equal production of B^0 and B^+ at the $\Upsilon(4S)$ resonance. The second error combines the systematic and theoretical uncertainties in quadrature. CSORNA 03 includes data used in ALAM 94. A full angular fit to three complex helicity amplitudes is performed.

[2] BORTOLETTO 92 reports $0.019 \pm 0.008 \pm 0.011$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- \rho^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$. We rescale to our best value $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D.

[3] ALBRECHT 90J reports $0.007 \pm 0.003 \pm 0.003$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- \rho^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$. We rescale to our best value $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D.

[4] ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \rightarrow D^0 \pi^+)$ and absolute $B(D^0 \rightarrow K^- \pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^- \pi^+ \pi^0)/B(D^0 \rightarrow K^- \pi^+)$ and $B(D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-)/B(D^0 \rightarrow K^- \pi^+)$.
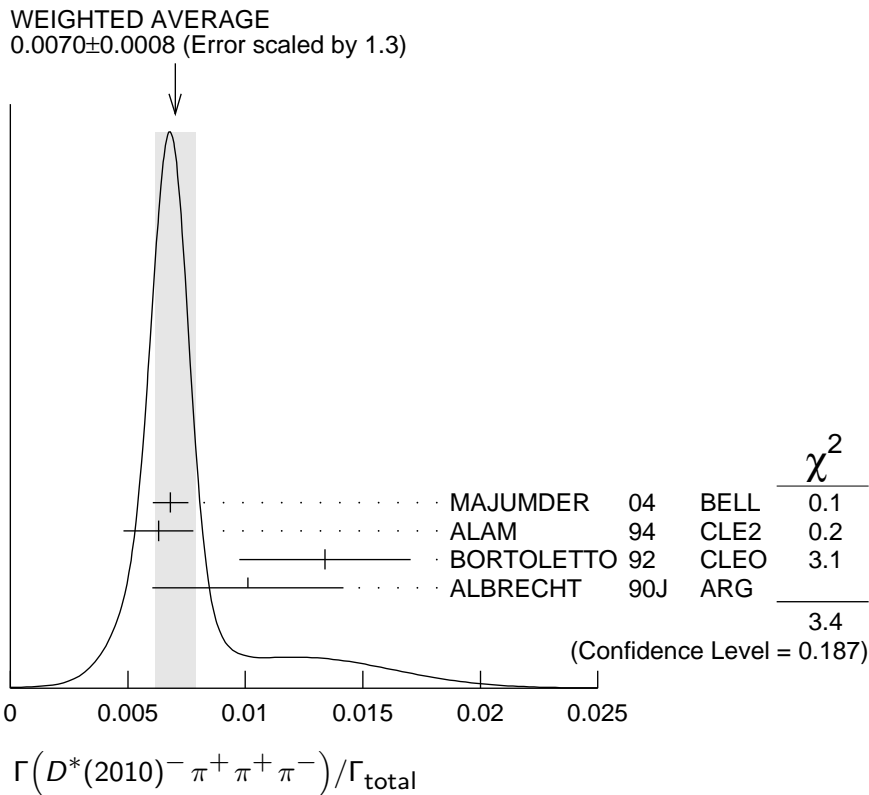

[5] This decay is nearly completely longitudinally polarized, $\Gamma_L/\Gamma = (93 \pm 5 \pm 5)\%$, as expected from the factorization hypothesis (ROSNER 90). The nonresonant $\pi^+ \pi^0$ contribution under the ρ^+ is less than 9% at 90% CL.

[6] Uses $B(D^* \rightarrow D^0 \pi^+) = 0.6 \pm 0.15$ and $B(\Upsilon(4S) \rightarrow B^0 \overline{B}^0) = 0.4$. Does not depend on D branching ratios.

[1] ZUPANC 07 reports $(7.5\pm0.2\pm1.1)\times10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^-D_s^+)/\Gamma_{total}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = (4.4 \pm 0.6) \times 10^{-2}$. We rescale to our best value $B(D_s^+ \to \phi\pi^+) = (4.39 \pm 0.34) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] AUBERT 06N reports $(0.64 \pm 0.13 \pm 0.10) \times 10^{-2}$ from a measurement of $[\Gamma(B^0 \to D^-D_s^+)/\Gamma_{total}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = 0.0462 \pm 0.0062$. We rescale to our best value $B(D_s^+ \to \phi\pi^+) = (4.39 \pm 0.34) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] GIBAUT 96 reports $0.0087 \pm 0.0024 \pm 0.0020$ from a measurement of $[\Gamma(B^0 \to D^-D_s^+)/\Gamma_{total}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = 0.035$. We rescale

to our best value $\mathrm{B}(D_s^+ \to \phi\pi^+) = (4.39 \pm 0.34) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] ALBRECHT 92G reports $0.017 \pm 0.013 \pm 0.006$ from a measurement of $[\Gamma(B^0 \to D^- D_s^+)/\Gamma_{\mathrm{total}}] \times [\mathrm{B}(D_s^+ \to \phi\pi^+)]$ assuming $\mathrm{B}(D_s^+ \to \phi\pi^+) = 0.027$. We rescale to our best value $\mathrm{B}(D_s^+ \to \phi\pi^+) = (4.39 \pm 0.34) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes PDG 1990 D^+ branching ratios, e.g., $\mathrm{B}(D^+ \to K^- 2\pi^+) = 7.7 \pm 1.0\%$.

[5] BORTOLETTO 92 reports $0.0080 \pm 0.0045 \pm 0.0030$ from a measurement of $[\Gamma(B^0 \to D^- D_s^+)/\Gamma_{\mathrm{total}}] \times [\mathrm{B}(D_s^+ \to \phi\pi^+)]$ assuming $\mathrm{B}(D_s^+ \to \phi\pi^+) = 0.030 \pm 0.011$. We rescale to our best value $\mathrm{B}(D_s^+ \to \phi\pi^+) = (4.39 \pm 0.34) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D.

[6] BORTOLETTO 90 assume $\mathrm{B}(D_s \to \phi\pi^+) = 2\%$. Superseded by BORTOLETTO 92.

$\Gamma(D^*(2010)^- D_s^+)/\Gamma_{\mathrm{total}}$ $\qquad\qquad\qquad\qquad\qquad$ Γ_{71}/Γ

$0.57\pm0.07\pm0.08$	[1,2]	AUBERT	08AB	BABR	$e^+e^- \to \Upsilon(4S)$	▮
$0.79^{+0.25}_{-0.23}\pm0.24$	[3,4]	AUBERT	07AV	BABR	$e^+e^- \to \Upsilon(4S)$	
$1.62\pm0.32^{+0.55}_{-0.60}$	[4]	FANG	03	BELL	$e^+e^- \to \Upsilon(4S)$	

[1] AUBERT 08AB reports [$\Gamma(B^0 \to \eta_c K^*(892)^0)/\Gamma_{total}$] / [B($B^+ \to \eta_c K^+$)] = $0.62 \pm 0.06 \pm 0.05$. We multiply by our best value B($B^+ \to \eta_c K^+$) = $(9.1 \pm 1.3) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Uses the production ratio of $(B^+B^-)/(B^0\overline{B}^0) = 1.026 \pm 0.032$ at $\Upsilon(4S)$.

[3] AUBERT 07AV reports [$\Gamma(B^0 \to \eta_c K^*(892)^0)/\Gamma_{total}$] $\times$ [B($\eta_c(1S) \to p\overline{p}$)] = $(1.03^{+0.27}_{-0.24} \pm 0.17) \times 10^{-6}$. We divide by our best value B($\eta_c(1S) \to p\overline{p}$) = $(1.3 \pm 0.4) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[1] AUBERT 07AV reports $[\Gamma(B^0 \to \ J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \ p\overline{p})]$ $= (2.82^{+0.30}_{-0.28}{}^{+0.36}_{-0.35}) \times 10^{-6}$. We divide by our best value $B(J/\psi(1S) \to \ p\overline{p}) = (2.17 \pm 0.07) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[3] ABE 98O reports $[B(B^0 \to \ J/\psi(1S)K^*(892)^0)]/[B(B^+ \to \ J/\psi(1S)K^+)] = 1.76 \pm 0.14 \pm 0.15$. We multiply by our best value $B(B^+ \to \ J/\psi(1S)K^+) = (9.9 \pm 1.0) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[5] BORTOLETTO 92 reports $(1.1 \pm 0.5 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to \ J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \ e^+e^-)]$ assuming $B(J/\psi(1S) \to \ e^+e^-) = 0.069 \pm 0.009$. We rescale to our best value $B(J/\psi(1S) \to \ e^+e^-) = (5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[6] ALBRECHT 90J reports $(1.1 \pm 0.5 \pm 0.2) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to \ J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \ e^+e^-)]$ assuming $B(J/\psi(1S) \to \ e^+e^-) = 0.069 \pm 0.009$. We rescale to our best value $B(J/\psi(1S) \to \ e^+e^-) = (5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[7] BEBEK 87 reports $(3.5 \pm 1.6 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to \ J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \ e^+e^-)]$ assuming $B(J/\psi(1S) \to \ e^+e^-) = 0.069 \pm 0.009$. We rescale to our best value $B(J/\psi(1S) \to \ e^+e^-) = (5.94 \pm 0.06) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.

[8] ABE 96H assumes that $B(B^+ \to J/\psi K^+) = (1.02 \pm 0.14) \times 10^{-3}$.

[9] The neutral and charged B events together are predominantly longitudinally polarized, $\Gamma_L/\Gamma =0.080 \pm 0.08 \pm 0.05$. This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the $B \to \psi K^*$ decay is dominated by the $CP = -1$ CP eigenstate. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[10] ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal, $\Gamma_T/\Gamma = 0.03 \pm 0.16 \pm 0.15$ making the neutral decay a CP eigenstate when the K^{*0} decays through $K^0_S \pi^0$.

[11] ALBAJAR 91E assumes B^0_d production fraction of 36%.

[12] ALBRECHT 87D assume $B^+ B^- / B^0 \overline{B}^0$ ratio is 55/45. Superseded by ALBRECHT 90J.

[13] ALAM 86 assumes $B^\pm/B^0$ ratio is 60/40. The observation of the decay $B^+ \to J/\psi K^*(892)^+$ (HAAS 85) has been retracted in this paper.

$\Gamma(J/\psi(1S) K^*(892)^0)/\Gamma(J/\psi(1S) K^0)$ $\Gamma_{161}/\Gamma_{159}$

<500	90	GILES	84	CLEO	$e^+e^-\to\ \Upsilon(4S)$

[1] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[2] ABULENCIA,A 06D reports $[\Gamma(B^0\to\ \pi^+\pi^-)/\Gamma_{total}]\ /\ [B(B^0\to\ K^+\pi^-)] = 0.21\pm 0.05\pm 0.03$. We multiply by our best value $B(B^0\to\ K^+\pi^-) = (1.94\pm 0.06)\times 10^{-5}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] ABE 00C assumes $B(Z\to\ b\overline{b})=(21.7\pm 0.1)\%$ and the B fractions $f_{B^0}=f_{B^+}= (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s}=(10.5^{+1.8}_{-2.2})\%$.

[4] ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$.

[5] BUSKULIC 96V assumes PDG 96 production fractions for B^0, B^+, B_s, b baryons.

[6] Assumes a B^0, B^- production fraction of 0.39 and a B_s production fraction of 0.12.

[7] Assumes $B(Z\to\ b\overline{b}) = 0.217$ and $B^0_d\ (B^0_s)$ fraction 39.5% (12%).

[8] Paper assumes the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$. We rescale to 50%.

[1] AALTONEN 09B reports $[\Gamma(B^0 \to K^*(892)^0\mu^+\mu^-)/\Gamma_{total}]$ / $[B(B^0 \to J/\psi(1S)K^*(892)^0)] = (0.61 \pm 0.23 \pm 0.07) \times 10^{-3}$. We multiply by our best value $B(B^0 \to J/\psi(1S)K^*(892)^0) = (1.33 \pm 0.06) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

[3] Assumes equal production of B^0 and B^+ at $\Upsilon(4S)$. The second error is a total of systematic uncertainties including model dependence.

[4] AFFOLDER 99B measured relative to $B^0 \to J/\psi(1S)K^*(892)^0$.

[5] ABE 96L measured relative to $B^0 \to J/\psi(1S)K^*(892)^0$ using PDG 94 branching ratios.

[6] ALBAJAR 91C assumes 36% of $\overline{b}$ quarks give B^0 mesons.

$\Gamma(K^*(892)^0\nu\overline{\nu})/\Gamma_{total}$ $\qquad$ Γ_{408}/Γ

Test for $\Delta B = 1$ weak neutral current. Allowed by higher-order electroweak interactions.

A REVIEW GOES HERE – Check our WWW List of Reviews

POLARIZATION IN B^0 DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel ($\parallel$) or perpendicular ($\perp$) to each other with the parameters Γ_L/Γ, $\Gamma_\perp/\Gamma$, and the relative phases $\phi_\parallel$ and $\phi_\perp$. See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

B^0-$\overline{B}^0$ MIXING PARAMETERS

For a discussion of B^0-$\overline{B}^0$ mixing see the note on "B^0-$\overline{B}^0$ Mixing" in the B^0 Particle Listings above.

χ_d is a measure of the time-integrated B^0-$\overline{B}^0$ mixing probability that a produced $B^0(\overline{B}^0)$ decays as a $\overline{B}^0(B^0)$. Mixing violates $\Delta B \neq 2$ rule.

$$\chi_d = \frac{x_d^2}{2(1+x_d^2)}$$

$$x_d = \frac{\Delta m_{B^0}}{\Gamma_{B^0}} = (m_{B_H^0} - m_{B_L^0})\,\tau_{B^0} \ ,$$

where H, L stand for heavy and light states of two B^0 CP eigenstates and $\tau_{B^0} = \frac{1}{0.5(\Gamma_{B_H^0} + \Gamma_{B_L^0})}$.

χ_d

This B^0-$\overline{B}^0$ mixing parameter is the probability (integrated over time) that a produced B^0 (or $\overline{B}^0$) decays as a $\overline{B}^0$ (or B^0), e.g. for inclusive lepton decays
$$\chi_d = \Gamma(B^0 \rightarrow \ell^-X \text{ (via } \overline{B}^0))/\Gamma(B^0 \rightarrow \ell^\pm X)$$
$$= \Gamma(\overline{B}^0 \rightarrow \ell^+X \text{ (via } B^0))/\Gamma(\overline{B}^0 \rightarrow \ell^\pm X)$$
Where experiments have measured the parameter $r = \chi/(1-\chi)$, we have converted to χ. Mixing violates the $\Delta B \neq 2$ rule.

Note that the measurement of χ at energies higher than the $\Upsilon(4S)$ have not separated χ_d from χ_s where the subscripts indicate $B^0(\overline{b}d)$ or $B_s^0(\overline{b}s)$. They are listed in the $B^\pm/B^0/B_s^0/b$-baryon ADMIXTURE section.

The experiments at $\Upsilon(4S)$ make an assumption about the $B^0\overline{B}^0$ fraction and about the ratio of the $B^\pm$ and B^0 semileptonic branching ratios (usually that it equals one).

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements, includes χ_d calculated from Δm_{B^0} and τ_{B^0}.

0.158 $^{+0.052}_{-0.059}$		ARTUSO	89	CLEO	$e^+e^- \to \Upsilon(4S)$
0.17 ±0.05		[8] ALBRECHT	87I	ARG	$e^+e^- \to \Upsilon(4S)$
<0.19	90	[9] BEAN	87B	CLEO	$e^+e^- \to \Upsilon(4S)$
<0.27	90	[10] AVERY	84	CLEO	$e^+e^- \to \Upsilon(4S)$

[1] BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\overline{B}{}^0 \to D^{*+}\pi^-$, ρ^- decays to determine the flavor of the B meson.

[2] ALBRECHT 94 reports $r=0.194 \pm 0.062 \pm 0.054$. We convert to χ for comparison. Uses tagged events (lepton + pion from D^*).

[3] BARTELT 93 analysis performed using tagged events (lepton+pion from D^*). Using dilepton events they obtain $0.157 \pm 0.016\,{}^{+0.033}_{-0.028}$.

[4] ALBRECHT 92L is a combined measurement employing several lepton-based techniques. It uses all previous ARGUS data in addition to new data and therefore supersedes ALBRECHT 87I. A value of $r = 20.6 \pm 7.0\%$ is directly measured. The value can be used to measure $x = \Delta M/\Gamma = 0.72 \pm 0.15$ for the B_d meson. Assumes $f_{+-}/f_0 = 1.0 \pm 0.05$ and uses $\tau_{B^\pm}/\tau_{B^0} = (0.95 \pm 0.14)\,(f_{+-}/f_0)$.

[5] Uses $D^{*+} K^\pm$ correlations.

[6] Uses $(D^{*+}\ell^-) K^\pm$ correlations.

[7] These experiments see a combination of B_s and B_d mesons.

[8] ALBRECHT 87I is inclusive measurement with like-sign dileptons, with tagged B decays plus leptons, and one fully reconstructed event. Measures $r=0.21 \pm 0.08$. We convert to χ for comparison. Superseded by ALBRECHT 92L.

[9] BEAN 87B measured $r < 0.24$; we converted to χ.

[10] Same-sign dilepton events. Limit assumes semileptonic BR for B^+ and B^0 equal. If $B^0/B^\pm$ ratio <0.58, no limit exists. The limit was corrected in BEAN 87B from $r < 0.30$ to $r < 0.37$. We converted this limit to χ.

$\Delta m_{B^0} = m_{B^0_H} - m_{B^0_L}$

$\Delta m_{B^0_s}$ is a measure of 2π times the B^0-$\overline{B}{}^0$ oscillation frequency in time-dependent mixing experiments.

The second "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements.

The first "OUR EVALUATION", also provided by the HFAG, includes Δm_d calculated from χ_d measured at $\Upsilon(4S)$.

[1] Uses opposite-side flavor-tagging with $B \rightarrow D^{(*)} \mu \nu_\mu X$ events.

[2] Measured using a simultaneous fit of the B^0 lifetime and $\overline{B}{}^0 B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0 \rightarrow D^{*-} \ell \nu$ decays.

[3] Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.

[4] Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.

[5] HASTINGS 03 measurement based on the time evolution of dilepton events. It also reports $f_+/f_0 = 1.01 \pm 0.03 \pm 0.09$ and *CPT* violation parameters in B^0-$\overline{B}{}^0$ mixing.

[6] ZHENG 03 data analyzed using partially reconstructed $\overline{B}{}^0 \rightarrow D^{*-} \pi^+$ decay and a flavor tag based on the charge of the lepton from the accompanying B decay.

[7] Uses a tagged sample of fully-reconstructed neutral B decays at $\Upsilon(4S)$.

[8] Measured based on the time evolution of dilepton events in $\Upsilon(4S)$ decays.

[9] Data analyzed using partially reconstructed $\overline{B}{}^0 \rightarrow D^{*+} \ell^- \overline{\nu}$ decay and a combination of flavor tags from the rest of the event.

[10] Uses di-muon events.

[11] Uses jet-charge and lepton-flavor tagging.

[12] Uses $\ell^- D^{*+} - \ell$ events.

[13] Uses π-B in the same side.

[14] Uses ℓ-ℓ.

[15] Uses ℓ-Q_{hem}.

[16] Uses ℓ-ℓ with impact parameters.

[17] Uses $D^{*\pm}$-Q_{hem}.

[18] Uses $\pi_s^\pm \ell$-Q_{hem}.

[19] Uses $D^{*\pm}$-ℓ/Q_{hem}.

[20] Uses $D^{*\pm} \ell$-Q_{hem}.

[21] Uses $D^{*\pm}$-ℓ.

[22] AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0 \rightarrow D^*(2010)^- \ell \nu$ and simultaneously measures the lifetime and oscillation frequency.

[23] AUBERT 02N result based on the same analysis and data sample reported in AUBERT 02I.

[24] Uses a tagged sample of B^0 decays reconstructed in the mode $B^0 \rightarrow D^* \ell \nu$.

[25] Uses a tagged sample of fully-reconstructed hadronic B^0 decays at $\Upsilon(4S)$.

[26] ACCIARRI 98D combines results from ℓ-ℓ, ℓ-Q_{hem}, and ℓ-ℓ with impact parameters.

[27] ABREU 97N combines results from $D^{*\pm}$-Q_{hem}, ℓ-Q_{hem}, $\pi_s^\pm \ell$-Q_{hem}, and ℓ-ℓ.

[28] ACKERSTAFF 97V combines results from ℓ-ℓ, ℓ-Q_{hem}, D^*-ℓ, and $D^{*\pm}$-Q_{hem}.

[29] BUSKULIC 97D combines results from $D^{*\pm}$-ℓ/Q_{hem}, ℓ-Q_{hem}, and ℓ-ℓ.

[30] ABREU 96Q analysis performed using lepton, kaon, and jet-charge tags.

[31] ALEXANDER 96V combines results from $D^{*\pm}$-ℓ and $D^{*\pm} \ell$-Q_{hem}.

[32] AKERS 95J combines results from charge measurement, $D^{*\pm} \ell$-Q_{hem} and ℓ-ℓ.

$x_d = \Delta m_{B^0} / \Gamma_{B^0}$

The second "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements.

The first "OUR EVALUATION", also provided by the HFAG, includes χ_d measured at $\Upsilon(4S)$.

VALUE	DOCUMENT ID
0.774±0.008 OUR EVALUATION	First
0.774±0.008 OUR EVALUATION	Second

$Re(\lambda_{CP} / |\lambda_{CP}|)$ Re(z)

The λ_{CP} characterizes B^0 and $\overline{B}^0$ decays to states of charmonium plus K^0_L. Parameter z is used to describe *CPT* violation in mixing, see the review on "*CP* Violation" in the reviews section.

0.038 ±0.029 ±0.025	[3] AUBERT,B 04C	BABR	Repl. by AUBERT 06T

[1] Assuming $\Delta\Gamma = 0$, the result becomes $Im(z) = -0.0037 \pm 0.0046$.
[2] Measured using inclusive dilepton events from B^0 decay.
[3] Corresponds to 90% confidence range $[-0.028, 0.104]$.

CP VIOLATION PARAMETERS

$\mathrm{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$

CP impurity in B^0_d system. It is obtained from either $a_{\ell\ell}$, the charge asymmetry in like-sign dilepton events or a_{cp}, the time-dependent asymmetry of inclusive B^0 and $\overline{B}^0$ decays.

The second "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at http://www.slac.stanford.edu/xorg/hfag/. The averaging/rescaling procedure takes into account correlations between the measurements. It assumes there is no *CP* violation in B_s mixing.

The first "OUR EVALUATION", also provided by the HFAG, uses the measurements from *B*-factories only.

< 45	[11] BARTELT	93	CLE2	$e^+e^- \to \Upsilon(4S)$

[1] Uses the dimuon charge asymmetry.

[2] AUBERT 06T reports $|q/p|-1=(-0.8\pm2.7\pm1.9)\times10^{-3}$. We convert to $(1-|q/p|^2)/4$.

[3] Uses the charge asymmetry in like-sign dilepton events and reports $|q/p| = 1.0005 \pm 0.0040 \pm 0.0043$.

[4] AUBERT 02K uses the charge asymmetry in like-sign dilepton events.

[5] BARATE 01D measured by investigating time-dependent asymmetries in semileptonic and fully inclusive B^0_d decays.

[6] JAFFE 01 finds $a_{\ell\ell} = 0.013 \pm 0.050 \pm 0.005$ and combines with the previous BEHRENS 00B independent measurement.

[7] Data analyzed using the time-dependent asymmetry of inclusive B^0 decay. The production flavor of B^0 mesons is determined using both the jet charge and the charge of secondary vertex in the opposite hemisphere.

[8] ACKERSTAFF 97U assumes *CPT* and is based on measuring the charge asymmetry in a sample of B^0 decays defined by lepton and Q_{hem} tags. If *CPT* is not invoked, $\mathrm{Re}(\epsilon_B) = -0.006 \pm 0.010 \pm 0.006$ is found. The indirect *CPT* violation parameter is determined to $\mathrm{Im}(\delta B) = -0.020 \pm 0.016 \pm 0.006$.

[9] AUBERT 04C reports $|q/p| = 1.029\pm0.013\pm0.011$ and we converted it to $(1-|q/p|^2)/4$.

[10] BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\overline{B}^0 \to D^{*+}\pi^-, \rho^-$ decays to determine the flavor of the B meson.

[11] BARTELT 93 finds $a_{\ell\ell} = 0.031 \pm 0.096 \pm 0.032$ which corresponds to $|a_{\ell\ell}| < 0.18$, which yields the above $|\mathrm{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)|$.

$A_{T/CP}$

$A_{T/CP}$ is defined as

$$\frac{P(\overline{B}^0 \to B^0) - P(B^0 \to \overline{B}^0)}{P(\overline{B}^0 \to B^0) + P(B^0 \to \overline{B}^0)},$$

the *CPT* invariant asymmetry between the oscillation probabilities $P(\overline{B}^0 \to B^0)$ and $P(B^0 \to \overline{B}^0)$.

VALUE	DOCUMENT ID		TECN	COMMENT
0.005±0.012±0.014	[1] AUBERT	02K	BABR	$e^+ e^- \to \Upsilon(4S)$

[1] AUBERT 02K uses the charge asymmetry in like-sign dilepton events.

$A_{CP}(B^0 \to D^*(2010)^+ D^-)$

A_{CP} is defined as

$$\frac{B(\overline{B}^0 \to \overline{f}) - B(B^0 \to f)}{B(\overline{B}^0 \to \overline{f}) + B(B^0 \to f)},$$

the *CP*-violation charge asymmetry of exclusive B^0 and $\overline{B}^0$ decay.

[1] Measurement based on $B^0 \to c\bar{c}K^{(*)0}$ decays.

[2] Based on $B^0 \to \psi(2S)K^0_S$ decays.

[3] AFFOLDER 00C uses about 400 $B^0 \to J/\psi(1S)K^0_S$ events. The production flavor of B^0 was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.

[4] BARATE 00Q uses 23 candidates for $B^0 \to J/\psi(1S)K^0_S$ decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the B^0 production flavor.

[5] ACKERSTAFF 98Z uses 24 candidates for $B^0_d \to J/\psi(1S)K^0_S$ decay. A combination of jet-charge and vertex-charge techniques were used to tag the B^0_d production flavor.

[6] Measurement based on 152×10^6 $B\overline{B}$ pairs.

[7] Measurement based on 227×10^6 $B\overline{B}$ pairs.

[8] Measurement in which the J/ψ decays to hadrons or to muons that do not satisfy the standard identification criteria.

[9] ABE 02U result is based on the same analysis and data sample reported in ABE 01G.

[10] ABE 02Z result is based on 85×10^6 $B\overline{B}$ pairs.

[11] AUBERT 02N result based on the same analysis and data sample reported in AUBERT 01B.

[12] AUBERT 02P result is based on 88×10^6 $B\overline{B}$ pairs.

[13] First observation of *CP* violation in B^0 meson system.

[14] ABE 98U uses 198 ± 17 $B^0_d \to J/\psi(1S)K^0$ events. The production flavor of B^0 was determined using the same side tagging technique.

$C_{J/\psi(nS)K^0}$ $(B^0 \to J/\psi(nS)K^0)$

[1] Uses fully reconstructed $B^0 \rightarrow D^{(*)\pm}\pi^\mp$ and $D^\pm\rho^\mp$ decays and some theoretical assumptions.

[2] Combines the results from fully reconstructed and partially reconstructed $D^{(*)}\pi$ events by taking weighted averages. Assumes that systematic errors from physics parameters and fit biases in the two measurements are 100% correlated.

[3] Uses partially reconstructed $B^0 \rightarrow D^{*\pm}\pi^\mp$ decays and some theoretical assumptions.

[4] Uses fully reconstructed $B^0 \rightarrow D^{(*)\pm}\pi^\mp$ decays and some theoretical assumptions, such as the SU(3) symmetry relation.

[5] Combining this measurement with the results from AUBERT 04V for fully reconstructed $B^0 \rightarrow D^{(*)\pm}\pi^\mp$ and some theoretical assumptions, such as the SU(3) symmetry relation.

2 $\beta + \gamma$

VALUE (°)	DOCUMENT ID		TECN	COMMENT	
83±53±20	[1] AUBERT	08AC	BABR	$e^+e^- \rightarrow \Upsilon(4S)$	❚

[1] Used a time-dependent Dalitz-plot analysis of $B^0 \rightarrow D^\mp K^0 \pi^\pm$ assuming the ratio of the $b \rightarrow u$ and $b \rightarrow c$ decay aamplitudes to be 0.3.

α

For angle $\alpha(\phi_2)$ of the CKM unitarity triangle, see the review on "*CP* violation" in the reviews section.

[1] Based on the favored $B \rightarrow \rho\rho$ isospin method.

[2] Obtained using isospin relation and selecting a solution closest to the CKM best fit average; the 90% CL allowed interval is $59° < \phi_2\ (\equiv \alpha) < 115°$.

[3] The angle α_{eff} is obtained using the measured *CP* parameters of $B^0 \rightarrow a_1(1260)^\pm \pi^\mp$ and choosing one of the four solutions that is compatible with the result of SM-based fits.

[4] Obtained using isospin relation and selecting a solution closest to the CKM best fit average; 90% CL allowed interval is $79° < \alpha < 123°$.

[5] Obtained from the measured *CP* parameters of the longitudinal polarization by selecting the solution closest to the CKM best fit central value of $\alpha = 95° - 98°$.
