

$\Lambda(1405) S_{01}$

$I(J^P) = 0(\frac{1}{2}^-)$ Status: ****

It seems to be the universal opinion of the chiral-unitary community that there are two poles in the 1400-MeV region. For discussions and earlier references, see for example MAGAS 05 and JIDO 03. ZYCHOR 08 presents experimental evidence against the two-pole model, but this is disputed by GENG 07A. See also REVAI 09, which finds little basis for choosing between one- and two-pole models.

See also the "Note on the $\Lambda(1405)$ " in our 2000 edition, The European Physical Journal **C15** 1 (2000).

A single, ordinary three-quark $\Lambda(1405)$ fits nicely into a $J^P = 1/2^-$ SU(4) $\bar{4}$ multiplet, whose other members are the $\Lambda_c(2595)^+$, $\Xi_c(2790)^+$, and $\Xi_c(2790)^0$; see Fig. 1 of our note on "Charmed Baryons."

 $\Lambda(1405)$ FOOTNOTES

- ¹ DALITZ 91 fits the HEMINGWAY 85 data.
- ² THOMAS 73 data is fit by CHAO 73 (see next section).
- ³ The KIMURA 00 values are from fits A and B from a coupled-channel potential model using low-energy $\bar{K}N$ and $\Sigma\pi$ data, kaonic-hydrogen x-ray measurements, and our $\Lambda(1405)$ mass and width. The results bear mainly on the *nature* of the $\Lambda(1405)$: three-quark state or $\bar{K}N$ bound state.
- ⁴ The MARTIN 81 fit includes the $K^\pm p$ forward scattering amplitudes and the dispersion relations they must satisfy.
- ⁵ See also the accompanying paper of THOMAS 73.
- ⁶ Data of SAKITT 65 are used in the fit by KITTEL 66.
- ⁷ An asymmetric shape, with $\Gamma/2 = 41$ MeV below resonance, 14 MeV above.
