# New Heavy Bosons (W', Z', leptoquarks, etc.), Searches for

We list here various limits on charged and neutral heavy vector bosons (other than W's and Z's), heavy scalar bosons (other than Higgs bosons), vector or scalar leptoquarks, and axigluons. The latest unpublished results are described in "W' Searches" and "Z'Searches" reviews. For recent searches on scalar bosons which could be identified as Higgs bosons, see the listings in the Higgs boson section.

#### MASS LIMITS for W' (Heavy Charged Vector Boson Other Than W) in Hadron Collider Experiments

Couplings of W' to quarks and leptons are taken to be identical with those of W. The following limits are obtained from  $p\overline{p}$  or  $pp \to W'X$  with W' decaying to the mode

indicated in the comments. New decay channels (e.g.,  $W' \to WZ$ ) are assumed to be suppressed. The most recent preliminary results can be found in the "W'-boson searches" review above.

#### W<sub>R</sub> (Right-Handed W Boson) MASS LIMITS

Assuming a light right-handed neutrino, except for BEALL 82, LANGACKER 89B, and COLANGELO 91.  $g_R=g_L$  assumed. [Limits in the section MASS LIMITS for W' below are also valid for  $W_R$  if  $m_{\nu_R}\ll m_{W_R}$ .] Some limits assume manifest left-right symmetry, i.e., the equality of left- and right Cabibbo-Kobayashi-Maskawa matrices. For a comprehensive review, see LANGACKER 89B. Limits on the  $W_I$ - $W_R$ 

mixing angle  $\zeta$  are found in the next section. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

<sup>&</sup>lt;sup>1</sup> The quoted limit is for manifest left-right symmetric model.

 $<sup>^{2}</sup>$  CZAKON 99 perform a simultaneous fit to charged and neutral sectors.

<sup>&</sup>lt;sup>3</sup> PRIEELS 14 limit is from  $\mu^+ \to e^+ \nu \overline{\nu}$  decay parameter  $\xi''$ , which is determined by the positron polarization measurement.

 $<sup>^4</sup>$  WAUTERS 10 limit is from a measurement of the asymmetry parameter of polarized  $^{60}$ Co  $\beta$  decays. The listed limit assumes no mixing.

<sup>&</sup>lt;sup>5</sup> ZHANG 08 limit uses a lattice QCD calculation of the relevant hadronic matrix elements, while BEALL 82 limit used the vacuum saturation approximation.

- <sup>6</sup> MELCONIAN 07 measure the neutrino angular asymmetry in  $\beta^+$ -decays of polarized  $^{37}$ K, stored in a magneto-optical trap. Result is consistent with SM prediction and does not constrain the  $W_I W_R$  mixing angle appreciably.
- <sup>7</sup> SCHUMANN 07 limit is from measurements of the asymmetry  $\langle \vec{p}_{\nu} \cdot \sigma_{n} \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing is assumed.
- <sup>8</sup> CYBURT 05 limit follows by requiring that three light  $\nu_R$ 's decouple when  $T_{dec} >$  140 MeV. For different  $T_{dec}$ , the bound becomes  $M_{W_R} >$  3.3 TeV  $(T_{dec}$  / 140 MeV)<sup>3/4</sup>.
- <sup>9</sup> THOMAS 01 limit is from measurement of  $\beta^+$  polarization in decay of polarized <sup>12</sup>N. The listed limit assumes no mixing.
- $^{10}$  ACKERSTAFF 99D limit is from au decay parameters. Limit increase to 145 GeV for zero mixing.
- $^{11}$  BARENBOIM 98 assumes minimal left-right model with Higgs of SU(2) $_R$  in SU(2) $_L$  doublet. For Higgs in SU(2) $_L$  triplet,  $m_{\sl W_R} > \! 1100$  GeV. Bound calculated from effect of corresponding  $Z_{LR}$  on electroweak data through  $Z\!-\!Z_{LR}$  mixing.
- <sup>12</sup> The quoted limit is from  $\mu$  decay parameters. BARENBOIM 97 also evaluate limit from  $K_L$ - $K_S$  mass difference.
- $^{13}$ STAHL 97 limit is from fit to au-decay parameters.
- $^{14}$  ALLET 96 measured polarization-asymmetry correlation in  $^{12}$  N  $\beta^+$  decay. The listed limit assumes zero L-R mixing.
- <sup>15</sup> KUZNETSOV 95 limit is from measurements of the asymmetry  $\langle \vec{p}_{\nu} \cdot \sigma_{n} \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing assumed. See also KUZNETSOV 94B.
- <sup>16</sup> KUZNETSOV 94B limit is from measurements of the asymmetry  $\langle \vec{p}_{\nu} \cdot \sigma_{n} \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing assumed.
- $^{17}$  BHATTACHARYYA 93 uses  $Z\text{-}Z^{\bar{I}}$  mixing limit from LEP '90 data, assuming a specific Higgs sector of SU(2)  $_L\times$  SU(2)  $_R\times$  U(1) gauge model. The limit is for  $m_t$  =200 GeV and slightly improves for smaller  $m_t$ .
- $^{18}\,\text{SEVERIJNS}$  93 measured polarization-asymmetry correlation in  $^{107}\,\text{ln}\,\beta^+$  decay. The listed limit assumes zero L-R mixing. Value quoted here is from SEVERIJNS 94 erratum.
- $^{19}\, \rm IMAZATO$  92 measure positron asymmetry in  $K^+ \to \mu^+ \nu_\mu$  decay and obtain  $\xi P_\mu > 0.990$  (90% CL). If  $W_R$  couples to  $u\overline{s}$  with full weak strength ( $V_{us}^R = 1$ ), the result corresponds to  $m_{W_R} > \!\! 653$  GeV. See their Fig. 4 for  $m_{W_R}$  limits for general  $|V_{us}^R|^2 = 1 |V_{ud}^R|^2$ .
- <sup>20</sup> POLAK 92B limit is from fit to muon decay parameters and is essentially determined by JODIDIO 86 data assuming  $\zeta$ =0. Supersedes POLAK 91.
- 21 AQUINO 91 limits obtained from neutron lifetime and asymmetries together with unitarity of the CKM matrix. Manifest left-right symmetry assumed. Stronger of the two limits also includes muon decay results.
- <sup>22</sup>COLANGELO 91 limit uses hadronic matrix elements evaluated by QCD sum rule and is less restrictive than BEALL 82 limit which uses vacuum saturation approximation. Manifest left-right symmetry assumed.
- <sup>23</sup> POLAK 91 limit is from fit to muon decay parameters and is essentially determined by JODIDIO 86 data assuming  $\zeta$ =0. Superseded by POLAK 92B.
- $^{24}\,\mathrm{BARBIERI}$  89B limit holds for  $m_{\nu_R} \leq 10$  MeV.
- <sup>25</sup> LANGACKER 89B limit is for any  $\nu_R$  mass (either Dirac or Majorana) and for a general class of right-handed quark mixing matrices.
- $^{26}$  BALKE 88 limit is for  $m_{\nu_{eR}}=0$  and  $m_{\nu_{\mu R}}\leq 50$  MeV. Limits come from precise measurements of the muon decay asymmetry as a function of the positron energy.
- <sup>27</sup> JODIDIO 86 is the same TRIUMF experiment as STOKER 85 (and CARR 83); however, it uses a different technique. The results given here are combined results of the two techniques. The technique here involves precise measurement of the end-point  $e^+$  spectrum in the decay of the highly polarized  $\mu^+$ .

 $^{29}\, \rm BERGSMA$  83 set limit  $m_{\slash\hspace{-0.4em}M_2}/m_{\slash\hspace{-0.4em}M_1}~>1.9$  at CL =90%.

<sup>31</sup> BEALL 82 limit is obtained assuming that  $W_R$  contribution to  $K_L^0 - K_S^0$  mass difference is smaller than the standard one, neglecting the top quark contributions. Manifest left-right symmetry assumed.

 $<sup>^{28}</sup>$  STOKER 85 is same TRIUMF experiment as CARR 83. Here they measure the decay  $e^+$  spectrum asymmetry above 46 MeV/c using a muon-spin-rotation technique. Assumed a light right-handed neutrino. Quoted limits are from combining with CARR 83.

 $<sup>^{30}</sup>$  CARR 83 is TRIUMF experiment with a highly polarized  $\mu^+$  beam. Looked for deviation from V-A at the high momentum end of the decay  $e^+$  energy spectrum. Limit from previous world-average muon polarization parameter is  $m_{W_R} > 240$  GeV. Assumes a light right-handed neutrino.

 $<sup>^2</sup>$  CZAKON 99 perform a simultaneous fit to charged and neutral sectors.

<sup>&</sup>lt;sup>3</sup> The quoted limit is from  $\mu$  decay parameters. BARENBOIM 97 also evaluate limit from  $K_I$ - $K_S$  mass difference.

 $<sup>^4</sup>$  MISHRA 92 limit is from the absence of extra large-x, large-y  $\overline{\nu}_{\mu}$  N  $\rightarrow~\overline{\nu}_{\mu}$  X events at Tevatron, assuming left-handed  $\nu$  and right-handed  $\overline{\nu}$  in the neutrino beam. The result gives  $\zeta^2(1-2m_{W_1}^2/m_{W_2}^2)\!\!<$  0.0015. The limit is independent of  $\nu_R$  mass.

<sup>&</sup>lt;sup>5</sup> AQUINO 91 limits obtained from neutron lifetime and asymmetries together with unitarity of the CKM matrix. Manifest left-right asymmetry is assumed.

 $<sup>^6\,\</sup>mathrm{BARBIERI}$  89B limit holds for  $m_{\nu_R} \leq 10$  MeV.

<sup>&</sup>lt;sup>7</sup> First JODIDIO 86 result assumes  $m_{W_R} = \infty$ , second is for unconstrained  $m_{W_R}$ .

#### Limits for $Z_{LR}$

 $Z_{LR}$  is the extra neutral boson in left-right symmetric models.  $g_L = g_R$  is assumed unless noted. Values in parentheses assume stronger constraint on the Higgs sector, usually motivated by specific left-right symmetric models (see the Note on the W'). Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino. Direct search bounds assume decays to Standard Model fermions only, unless noted.

#### Limits for $Z_n$

 $Z_{\eta}$  is the extra neutral boson in E $_6$  models, corresponding to  $Q_{\eta}=\sqrt{3/8}~Q_{\chi}-\sqrt{5/8}~Q_{\psi}$ .  $g_{\eta}=e/\cos\theta_W$  is assumed unless otherwise stated. We list limits with the assumption  $\rho=1$  but with no further constraints on the Higgs sector. Values in parentheses assume stronger constraint on the Higgs sector motivated by superstring models. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

#### Indirect Constraints on Kaluza-Klein Gauge Bosons

Bounds on a Kaluza-Klein excitation of the Z boson or photon in d=1 extra dimension. These bounds can also be interpreted as a lower bound on 1/R, the size of the extra dimension. Unless otherwise stated, bounds assume all fermions live on a single brane and all gauge fields occupy the 4+d-dimensional bulk. See also the section on "Extra Dimensions" in the "Searches" Listings in this Review.

- $^{1}$  MUECK 02 limit is  $2\sigma$  and is from global electroweak fit ignoring correlations among observables. Higgs is assumed to be confined on the brane and its mass is fixed. For scenarios of bulk Higgs, of brane-SU(2)\_L, bulk-U(1)\_{\gamma}, and of bulk-SU(2)\_L, brane-U(1)\_{\gamma}, the corresponding limits are > 4.6 TeV, > 4.3 TeV and > 3.0 TeV, respectively.
- <sup>2</sup>Bound is derived from limits on  $e\nu q q'$  contact interaction, using data from HERA and the Tevatron.
- Bound holds only if first two generations of quarks lives on separate branes. If quark mixing is not complex, then bound lowers to 400 TeV from  $\Delta m_K$ .
- $^4$  See Figs. 1 and 2 of DELGADO 00 for several model variations. Special boundary conditions can be found which permit KK states down to 950 GeV and that agree with the measurement of  $Q_W({\rm Cs})$ . Quoted bound assumes all Higgs bosons confined to brane; placing one Higgs doublet in the bulk lowers bound to 2.3 TeV.
- <sup>5</sup> Bound is derived from global electroweak analysis assuming the Higgs field is trapped on the matter brane. If the Higgs propagates in the bulk, the bound increases to 3.8 TeV.
- $^6$  Bound is derived from global electroweak analysis but considering only presence of the  $\_$ KK W bosons.
- <sup>7</sup> Global electroweak analysis used to obtain bound independent of position of Higgs on brane or in bulk.
- <sup>8</sup> Bounds from effect of KK states on  $G_F$ ,  $\alpha$ ,  $M_W$ , and  $M_Z$ . Hard cutoff at string scale determined using gauge coupling unification. Limits for d=2,3,4 rise to 3.5, 5.7, and 7.8 TeV.
- <sup>9</sup> Bound obtained for Higgs confined to the matter brane with  $m_H$ =500 GeV. For Higgs in the bulk, the bound increases to 3.5 TeV.

- <sup>84</sup> ABBOTT 98E search for scalar leptoquarks using  $e\nu jj$ , eejj, and  $\nu\nu jj$  events in  $p\overline{p}$  collisions at  $E_{\rm cm}=1.8$  TeV. The limit above assumes B(eq)=1. For B(eq)=0.5 and 0, the bound becomes 204 and 79 GeV, respectively.
- <sup>85</sup> ABBOTT 98J search for charge -1/3 third generation scalar and vector leptoquarks in  $p\overline{p}$  collisions at  $E_{\rm cm}=1.8$  TeV. The quoted limit is for scalar leptoquark with B( $\nu b$ )=1.
- <sup>86</sup> ABE 98S search for scalar leptoquarks using  $\mu\mu jj$  events in  $p\overline{p}$  collisions at  $E_{\rm cm}=$  1.8 TeV. The limit is for B( $\mu q$ )= 1. For B( $\mu q$ )=B( $\nu q$ )=0.5, the limit is > 160 GeV.
- 87 GROSS-PILCHER 98 is the combined limit of the CDF and DØ Collaborations as determined by a joint CDF/DØ working group and reported in this FNAL Technical Memo. Original data published in ABE 97X and ABBOTT 98E.
- <sup>88</sup> ABE 97F search for third generation scalar and vector leptoquarks in  $p\overline{p}$  collisions at  $E_{\rm cm}=1.8$  TeV. The quoted limit is for scalar leptoquark with B $(\tau\,b)=1$ .
- <sup>89</sup> ABE 97X search for scalar leptoquarks using eejj events in  $p\overline{p}$  collisions at  $E_{cm}=1.8$  TeV. The limit is for B(eq)=1.
- $^{90}$  Limit is for charge -1/3 isospin-0 leptoquark with B $(\ell q)=2/3$ .
- <sup>91</sup> First and second generation leptoquarks are assumed to be degenerate. The limit is slightly lower for each generation.
- <sup>92</sup> Limits are for charge -1/3, isospin-0 scalar leptoquarks decaying to  $\ell^- q$  or  $\nu q$  with any branching ratio. See paper for limits for other charge-isospin assignments of leptoquarks.
- <sup>93</sup> KIM 90 assume pair production of charge 2/3 scalar-leptoquark via photon exchange. The decay of the first (second) generation leptoquark is assumed to be any mixture of  $de^+$  and  $u\overline{\nu}$  ( $s\mu^+$  and  $c\overline{\nu}$ ). See paper for limits for specific branching ratios.
- <sup>94</sup> BARTEL 87B limit is valid when a pair of charge 2/3 spinless leptoquarks X is produced with point coupling, and when they decay under the constraint B(X  $\to c \overline{\nu}_{\mu}$ ) + B(X  $\to s \mu^+$ ) = 1.
- 95 BEHREND 86B assumed that a charge 2/3 spinless leptoquark,  $\chi$ , decays either into  $s\mu^+$  or  $c\overline{\nu}$ : B( $\chi \to s\mu^+$ ) + B( $\chi \to c\overline{\nu}$ ) = 1.

### MASS LIMITS for Leptoquarks from Single Production

These limits depend on the q- $\ell$ -leptoquark coupling  $g_{LQ}$ . It is often assumed that  $g_{LQ}^2/4\pi=1/137$ . Limits shown are for a scalar, weak isoscalar, charge -1/3 leptoquark.

- $^1$  SIRUNYAN  $21\mathrm{J}$  search for single production of charge -1/3 scalar leptoquarks decaying to  $t\tau^-$  and  $b\nu$ , and charge 2/3 vector leptoquarks decaying to  $t\nu$  and  $b\tau^+$  in pp collisions at  $\sqrt{s}=13$  TeV. The limit quoted above assumes a scalar leptoquark with  $\mathrm{B}(t\tau)=\mathrm{B}(b\nu)=0.5$  and the leptoquark coupling strength  $\lambda=1.5$ . The limit becomes  $M_{LQ}>750$  GeV for  $\lambda=2.5$ .
- <sup>2</sup> SIRUNYAN 18BJ search for single production of charge 2/3 scalar leptoquarks decaying to  $\tau b$  in pp collisions at  $\sqrt{s}=13$  TeV. The limit above assumes B( $\tau b$ ) =1 and the leptoquark coupling strength  $\lambda=1$ .
- $^3$  KHACHATRYAN 16AG search for single production of charge  $\pm 1/3$  scalar leptoquarks using  $e\,e\,j$  events in  $p\,p$  collisions at  $\sqrt{s}=8$  TeV. The limit above assumes B( $e\,q$ ) = 1 and the leptoquark coupling strength  $\lambda=1$ .
- <sup>4</sup> KHACHATRYAN 16AG search for single production of charge  $\pm 1/3$  scalar leptoquarks using  $\mu\mu j$  events in pp collisions at  $\sqrt{s}=8$  TeV. The limit above assumes  $\mathrm{B}(\mu q)=1$  and the leptoquark coupling strength  $\lambda=1$ .
- $^5$  ABRAMOWICZ 12A limit is for a scalar, weak isoscalar, charge -1/3 leptoquark coupled with  $e_R$ . See their Figs. 12–17 and Table 4 for states with different quantum numbers.
- <sup>6</sup> Limit from single production in Z decay. The limit is for a leptoquark coupling of electromagnetic strength and assumes  $B(\ell q) = 2/3$ . The limit is 77 GeV if first and second leptoquarks are degenerate.
- $^7$  AAD 22E leptoquarks decaying both to  $u\,e^-$  and  $c\,\mu^-$  are constrained from the comparison of the production cross sections for  $e^+\,\mu^-$  and  $e^-\,\mu^+$  in  $p\,p$  collisions at  $\sqrt{s}=13$  TeV. Scalar leptoquarks with  $M_{LQ}~<1880$  GeV are excluded for  $g^{eu}=g^{\mu\,c}=1$ .
- $^8$  TUMASYAN 21D search for energetic jets  $+ \not\!\!E_T$  events in pp collisions at  $\sqrt{s}=13$  TeV. The branching fraction for the decay of the leptoquark into an electron neutrino and up quark is assumed to be 100% ( $\beta=0$ ). See their Fig. 12 for exclusion limits in mass-coupling plane.
- <sup>9</sup> DEY 16 use the 2010-2012 IceCube PeV energy data set to constrain the leptoquark production cross section through the  $\nu q \to LQ \to \nu q$  process. See their Figure 4 for the exclusion limit in the mass-coupling plane.
- <sup>10</sup> AARON 11A search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 2–3 and Tables 1–4 for detailed limits.
- <sup>11</sup> The quoted limit is for a scalar, weak isoscalar, charge -1/3 leptoquark coupled with  $e_R$ . See their Figs. 3–5 for limits on states with different quantum numbers.
- <sup>12</sup> ABAZOV 07E search for leptoquark single production through qg fusion process in  $p\overline{p}$  collisions. See their Fig. 4 for exclusion plot in mass-coupling plane.
- $^{13}$  AKTAS 05B limit is for a scalar, weak isoscalar, charge -1/3 leptoquark coupled with  $e_R$ . See their Fig. 3 for limits on states with different quantum numbers.
- 14 CHEKANOV 05 search for various leptoquarks with lepton-flavor violating couplings. See their Figs.6–10 and Tables 1–8 for detailed limits.

- $^{15}$  CHEKANOV 03B limit is for a scalar, weak isoscalar, charge -1/3 leptoquark coupled with  $e_R$ . See their Figs. 11–12 and Table 5 for limits on states with different quantum numbers.
- <sup>16</sup> For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 4 and Fig. 5.
- <sup>17</sup> CHEKANOV 02 search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 6–7 and Tables 5–6 for detailed limits.
- <sup>18</sup> For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 3.
- $^{19}$  See their Fig. 14 for limits in the mass-coupling plane.
- $^{20}$  BREITWEG 00E search for F=0 leptoquarks in  $e^+p$  collisions. For limits in mass-coupling plane, see their Fig. 11.
- <sup>21</sup> ABREU 99G limit obtained from process  $e\gamma \to LQ+q$ . For limits on vector and scalar states with different quantum numbers and the limits in the coupling-mass plane, see their Fig. 4 and Table 2.
- <sup>22</sup> For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 13 and Fig. 14. ADLOFF 99 also search for leptoquarks with lepton-flavor violating couplings. ADLOFF 99 supersedes AID 96B.
- <sup>23</sup> DERRICK 97 search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 5–8 and Table 1 for detailed limits.
- <sup>24</sup> DERRICK 93 search for single leptoquark production in ep collisions with the decay eq and  $\nu q$ . The limit is for leptoquark coupling of electromagnetic strength and assumes  $B(eq) = B(\nu q) = 1/2$ . The limit for B(eq) = 1 is 176 GeV. For limits on states with different quantum numbers, see their Table 3.

 $^1$  CRIVELLIN 21A set limits on coupling strengths of scalar and vector leptoquarks using  $K\to~\pi\nu\nu,~K\to~\pi\,e^+\,e^-,~K^0-\overline{K}^0$  and  $D^0-\overline{D}^0$  mixings, and weak neutral current measurements. See their Fig. 2 and Fig. 3 for the limits in mass-coupling plane.

<sup>2</sup> AEBISCHER 20 explain the B decay anomalies using four-fermion operator Wilson coefficients. See their Table 1. These Wilson coefficients may be generated by a  $U_1$  vector leptoquark with  $U_1$  transforming as  $(3,1)_{2/3}$  under the SM gauge group. See their Figures 6, 7, 8 for the regions of the LQ parameter space which explains the B anomalies and avoids the indirect low energy constraints.

<sup>3</sup> DEPPISCH 20 limits on the lepton-number-violating higher-dimensional-operators are derived from  $K \to \pi \nu \nu$  in the standard model effective field theory. These higher-dimensional-operators may be induced from leptoquark-exchange diagrams.

 $^4$  ABRAMOWICZ 19 obtain a limit on  $\lambda/M_{LQ}>1.16~{\rm TeV}^{-1}$  for weak isotriplet spin-0 leptoquark  $S_1^L$ . We obtain the limit quoted above by converting the limit on  $\lambda/M_{LQ}$  for  $S_1^L$  assuming  $\lambda=\sqrt{4\pi}.$  See their Table 5 for the limits of leptoquarks with different quantum numbers. These limits are derived from bounds of eq contact interactions.

<sup>5</sup> MANDAL 19 give bounds on leptoquarks from au-decays, leptonic dipole moments, lepton-flavor-violating processes, and K decays.

<sup>6</sup> ZHANG 18A give bounds on leptoquark induced four-fermion interactions from  $D \to K\ell\nu$ . The authors inform us that the shape parameter of the vector form factor in both the abstract and the conclusions of ZHANG 18A should be  $r_{+1}=2.16\pm0.07$  rather than  $\pm0.007$ . The numbers listed in their Table 7 are correct.

 $^7$  BARRANCO 16 give bounds on leptoquark induced four-fermion interactions from  $D\to K\ell\nu$  and  $D_{\rm S}\to \ell\nu.$ 

<sup>8</sup> KUMAR 16 gives bound on SU(2) singlet scalar leptoquark with chrge -1/3 from  $K^0-\overline{K}^0$  mixing,  $K\to \pi\nu\overline{\nu},~K^0_L\to \mu^+\mu^-$ , and  $K^0_L\to \mu^\pm e^\mp$  decays.

<sup>9</sup> BESSAA 15 obtain limit on leptoquark induced four-fermion interactions from the ATLAS and CMS limit on the  $\overline{q}q\overline{e}e$  contact interactions.

- $^{10}$  SAHOO 15A obtain limit on leptoquark induced four-fermion interactions from  $B_{s,d} 
  ightarrow$  $\mu^+\mu^-$  for  $\lambda \simeq O(1)$ .
- $^{11}$  SAKAKI 13 explain the  $B o D^{(*)} au \overline{
  u}$  anomaly using Wilson coefficients of leptoquarkinduced four-fermion operators.
- $^{12}$  KOSNIK 12 obtains limits on leptoquark induced four-fermion interactions from b 
  ightarrow
- <sup>13</sup> AARON 11C limit is for weak isotriplet spin-0 leptoquark at strong coupling  $\lambda = \sqrt{4\pi}$ . For the limits of leptoquarks with different quantum numbers, see their Table 3. Limits are derived from bounds of eq contact intereractions.
- $^{14}$  DORSNER 11 give bounds on scalar, weak singlet, charge 4/3 leptoquark from K, B, audecays, meson mixings, LFV, g-2 and  $Z \rightarrow b\overline{b}$ .
- $^{15}$  AKTAS 07A search for lepton-flavor violation in ep collision. See their Tables 4–7 for limits on lepton-flavor violating four-fermion interactions induced by various leptoquarks.
- $^{16}\,\mathsf{SCHAEL}$  07A limit is for the weak-isoscalar spin-0 left-handed leptoquark with the coupling of electromagnetic strength. For the limits of leptoquarks with different quantum numbers, see their Table 35.
- $^{
  m 17}$  SMIRNOV 07 obtains mass limits for the vector and scalar chiral leptoquark states from  $K \rightarrow e\mu$ ,  $B \rightarrow e\tau$  decays.
- $^{18}\,\text{CHEKANOV}$  05 search for various leptoquarks with lepton-flavor violating couplings. See their Figs.6-10 and Tables 1-8 for detailed limits.
- <sup>19</sup> ADLOFF 03 limit is for the weak isotriplet spin-0 leptoquark at strong coupling  $\lambda = \sqrt{4\pi}$ . For the limits of leptoquarks with different quantum numbers, see their Table 3. Limits are derived from bounds on  ${\rm e}^\pm\,q$  contact interactions.  $^{20}\,{\rm The}$  bound is derived from  ${\rm B}(B^0\to~{\rm e}^\pm\,\mu^\mp)<~1.7\times10^{-7}$  .
- $^{21}$  CHEKANOV 02 search for lepton-flavor violation in  $\it ep$  collisions. See their Tables 1–4 for limits on lepton-flavor violating and four-fermion interactions induced by various leptoquarks.
- $^{22}$  CHEUNG 01B quoted limit is for a scalar, weak isoscalar, charge -1/3 leptoquark with a coupling of electromagnetic strength. The limit is derived from bounds on contact interactions in a global electroweak analysis. For the limits of leptoquarks with different quantum numbers, see Table 5.
- <sup>23</sup> ACCIARRI 00P limit is for the weak isoscalar spin-0 leptoquark with the coupling of electromagnetic strength. For the limits of leptoquarks with different quantum numbers, see their Table 4.
- 24 ADLOFF 00 limit is for the weak isotriplet spin-0 leptoquark at strong coupling,  $\lambda = \sqrt{4\pi}$ . For the limits of leptoquarks with different quantum numbers, see their Table 2. ADLOFF 00 limits are from the  $Q^2$  spectrum measurement of  $e^+p \rightarrow e^+X$ .
- $^{25}$  BARATE 001 search for deviations in cross section and jet-charge asymmetry in  $e^+\,e^- 
  ightarrow$  $\overline{q}q$  due to t-channel exchange of a leptoquark at  $\sqrt{s}$ =130 to 183 GeV. Limits for other scalar and vector leptoquarks are also given in their Table 22.
- $^{26}\,\mathrm{BARGER}$  00 explain the deviation of atomic parity violation in cesium atoms from prediction is explained by scalar leptoquark exchange.
- $^{
  m 27}$  GABRIELLI 00 calculate various process with lepton flavor violation in leptoquark models.
- <sup>28</sup> ZARNECKI 00 limit is derived from data of HERA, LEP, and Tevatron and from various low-energy data including atomic parity violation. Leptoquark coupling with electromagnetic strength is assumed.
- <sup>29</sup> ABBIENDI 99 limits are from  $e^+e^- \rightarrow q \overline{q}$  cross section at 130–136, 161–172, 183 GeV. See their Fig. 8 and Fig. 9 for limits in mass-coupling plane.  $^{30}$  ABE 98V quoted limit is from B( $B_s \rightarrow e^{\pm} \mu^{\mp}) < 8.2 \times 10^{-6}$ . ABE 98V also obtain
- a similar limit on  $M_{LQ}$  > 20.4 TeV from B( $B_d$  ightarrow  ${
  m e}^{\pm}\mu^{\mp}$ )< 4.5 imes 10 $^{-6}$ . Both bounds assume the non-canonical association of the b quark with electrons or muons under SU(4).
- <sup>31</sup> ACCIARRI 98J limit is from  $e^+e^- o q \overline{q}$  cross section at  $\sqrt{s}$ = 130–172 GeV which can be affected by the t- and u-channel exchanges of leptoquarks. See their Fig. 4 and Fig. 5 for limits in the mass-coupling plane.

- <sup>32</sup> ACKERSTAFF 98V limits are from  $e^+e^- \rightarrow q \overline{q}$  and  $e^+e^- \rightarrow b \overline{b}$  cross sections at  $\sqrt{s} = 130$ –172 GeV, which can be affected by the t- and u-channel exchanges of leptoquarks. See their Fig. 21 and Fig. 22 for limits of leptoquarks in mass-coupling plane.
- $^{33}$  DEANDREA 97 limit is for  $\widetilde{R}_2$  leptoquark obtained from atomic parity violation (APV). The coupling of leptoquark is assumed to be electromagnetic strength. See Table 2 for limits of the four-fermion interactions induced by various scalar leptoquark exchange. DEANDREA 97 combines APV limit and limits from Tevatron and HERA. See Fig. 1–4 for combined limits of leptoquark in mass-coupling plane.
- <sup>34</sup> DERRICK 97 search for lepton-flavor violation in *ep* collision. See their Tables 2–5 for limits on lepton-flavor violating four-fermion interactions induced by various leptoquarks.
- <sup>35</sup> GROSSMAN 97 estimate the upper bounds on the branching fraction  $B \to \tau^+ \tau^-(X)$  from the absence of the B decay with large missing energy. These bounds can be used to constrain leptoquark induced four-fermion interactions.
- <sup>36</sup> JADACH 97 limit is from  $e^+e^- \rightarrow q\overline{q}$  cross section at  $\sqrt{s}$ =172.3 GeV which can be affected by the t- and u-channel exchanges of leptoquarks. See their Fig. 1 for limits on vector leptoquarks in mass-coupling plane.
- <sup>37</sup> KUZNETSOV 95B use  $\pi$ , K, B,  $\tau$  decays and  $\mu e$  conversion and give a list of bounds on the leptoquark mass and the fermion mixing matrix in the Pati-Salam model. The quoted limit is from  $K_I \to \mu e$  decay assuming zero mixing.
- <sup>38</sup> MIZUKOSHI 95 calculate the one-loop radiative correction to the *Z*-physics parameters in various scalar leptoquark models. See their Fig. 4 for the exclusion plot of third generation leptoquark models in mass-coupling plane.
- BHATTACHARYYA 94 limit is from one-loop radiative correction to the leptonic decay width of the Z.  $m_H$ =250 GeV,  $\alpha_s(m_Z)$ =0.12,  $m_t$ =180 GeV, and the electroweak strength of leptoquark coupling are assumed. For leptoquark coupled to  $\overline{e}_L t_R$ ,  $\overline{\mu} t$ , and  $\overline{\tau} t$ , see Fig. 2 in BHATTACHARYYA 94B erratum and Fig. 3.
- <sup>40</sup> DAVIDSON 94 gives an extensive list of the bounds on leptoquark-induced four-fermion interactions from  $\pi$ , K, D, B,  $\mu$ ,  $\tau$  decays and meson mixings, *etc.* See Table 15 of DAVIDSON 94 for detail.
- <sup>41</sup> KUZNETSOV 94 gives mixing independent bound of the Pati-Salam leptoquark from the cosmological limit on  $\pi^0 \to \overline{\nu}\nu$ .
- <sup>42</sup> LEURER 94, LEURER 94B limits are obtained from atomic parity violation and apply to any chiral leptoquark which couples to the first generation with electromagnetic strength. For a nonchiral leptoquark, universality in  $\pi_{\ell 2}$  decay provides a much more stringent bound.
- 43 MAHANTA 94 gives bounds of *P* and *T*-violating scalar-leptoquark couplings from atomic and molecular experiments.
- <sup>44</sup> From  $(\pi \to e\nu)/(\pi \to \mu\nu)$  ratio. SHANKER 82 assumes the leptoquark induced four-fermion coupling  $4g^2/M^2$   $(\overline{\nu}_{eL} \ u_R)$   $(\overline{d}_L e_R)$ with g=0.004 for spin-0 leptoquark and  $g^2/M^2$   $(\overline{\nu}_{eL} \ v_L u_L)$   $(\overline{d}_R \ \gamma^\mu e_R)$  with g=0.6 for spin-1 leptoquark.
