- ² HAYRAPETYAN 24AQ based on 138 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Pair production of vector-like b' is searched for in the fully hadronic final states and those containing $\ell^+\ell^-$ from a Z boson. The data are consistent with the SM background predictions and limits are obtained for different branching ratios B($b' \rightarrow Hb$), B($b' \rightarrow Zb$), B($b' \rightarrow Wt$).
- 3 TUMASYAN 23V based on 138 fb $^{-1}$ of pp data at $\sqrt{s}=13$ TeV. Pair production of vector-like b' is seached for in the single-lepton, same-sign charge dilepton and multi-lepton channels. The data are consistent with the SM background predictions and limits are obtained for different branching ratios.
- ⁴ SIRUNYAN 20BI based on 137 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Pair production of vector-like b' is seached for with each b' decaying into Zb or hb. Analysis focuses on final states consisting of jets from six quarks. Mass limits are obtained for a variety of branching ratios of b' decays.
- ⁵ AABOUD 18CE based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s}=13$ TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of b' into Zb, Wt and Hb as predicted by the model.
- ⁶ AABOUD 18CL, AABOUD 18CP based on 36.1 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is particularly powerful for the $b'\to hb$ mode. Assuming the pure decay only in this mode sets a limit $m_{b'}>1010$ GeV.
- ⁷AABOUD 18CP based on 36.1 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Pair and single production of vector-like b' are seached for with at least one b' decaying into Zb. In the case of B($b' \rightarrow Zb$) = 1, the limit is $m_{b'} > 1220$ GeV.
- ⁸ The limit is for the singlet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- ⁹ The limit is for the doublet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- 10 AABOUD 18CR based on 36.1 fb $^{-1}$ of pp data at $\sqrt{s}=13$ TeV. A combination of searches for the pair-produced vector-like b' in various decay channels ($b'\to W\,t,\,Z\,b,\,h\,b$). Also a model-independent limit is obtained as $m_{b'}>1.03$ TeV, assuming that the branching ratios into $Z\,b,\,W\,t,$ and $h\,b$ add up to one.

¹¹ The limit is for the singlet b'.

- $^{12}\,\text{The limit}$ is for b' in a weak isospin doublet (t',b') and $|V_{t'b}|\,\ll\,|V_{tb'}|.$ For a b' in a doublet with a charge -4/3 vector-like quark, the limit $m_{b'}>1.14$ TeV is obtained.
- ¹³ SIRUNYAN 17AU based on 2.3–2.6 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Limit on pair-produced singlet vector-like b' using one lepton and several jets. The mass bound is given for a b' transforming as a singlet under the electroweak symmetry group, assumed to decay through W, Z or Higgs boson (which decays to jets) and to a third generation quark.
- ^14 AAD 15Z based on 20.3 fb $^{-1}$ of pp data at $\sqrt{s}=8$ TeV. Used events with $\ell+E_T+2$ 6j (≥ 1 b) and at least one pair of jets from weak boson decay, primarily designed to select the signature $b'\overline{b}'\to WWt\overline{t}\to WWWWb\overline{b}$. This is a limit on pair-produced vector-like b'. The lower mass limit is 640 GeV for a vector-like singlet b'.
- 15 Result is based on $1.1~{\rm fb}^{-1}$ of data. No signal is found for the search of long-lived particles which decay into final states with two electrons or photons, and upper bound on the cross section times branching fraction is obtained for $2 < c\tau < 7000~{\rm mm}$; see Fig. 3. 95% CL excluded region of b' lifetime and mass is shown in Fig. 4.
- 16 ACOSTA 03 looked for long-lived fourth generation quarks in the data sample of 90 pb $^{-1}$ of $\sqrt{s}{=}1.8$ TeV $p\overline{p}$ collisions by using the muon-like penetration and anomalously high ionization energy loss signature. The corresponding lower mass bound for the charge (2/3)e quark (t') is 220 GeV. The t' bound is higher than the b' bound because t' is more likely to produce charged hadrons than b'. The 95% CL upper bounds for the production cross sections are given in their Fig. 3.
- 17 AAD 23AG based on 139 fb $^{-1}$ of $p\,p$ data at $\sqrt{s}=13$ TeV. Pair production of vector-like top or bs is searched for in the mode $1\ell+\geq 4\mathrm{j}(\geq 1\mathrm{b}\text{-tagged})+\not\!\!E_T$. The data are consistent with the SM background predictions and limits are obtained for different branching ratios. Masses below 1.59 TeV are excluded assuming a mass-degenerate vector-like doublet (t',b') model.
- ^18 AAD 23AV based on 139 fb $^{-1}$ of $p\,p$ data at $\sqrt{s}=$ 13 TeV. Pair production of vector-like b' is searched for in the mode $\ell^{\pm}\ell^{\mp}+\geq 2{\rm j}$ (\geq 1b-tagged) + $\not\!\!E_T$ or with 3ℓ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios.
- ¹⁹ SIRUNYAN 19AQ based on 35.9 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Pair production of vector-like b' is seached for with one b' decaying into Zb and the other b' decaying into Wt, Zb, hb. Events with an opposite-sign lepton pair consistent with coming from Z and jets are used. Mass limits are obtained for a variety of branching ratios of b'.
- $^{20}\, \rm SIRUNYAN \ 19BW \ based \ on \ 35.9 \ fb^{-1} \ of \ pp \ data \ at \ \sqrt{s} = 13 \ TeV.$ The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is made for the Zb, Wt, hb modes and mass limits are obtained for a variety of branching ratios.
- ²¹ AABOUD 18AW based on 36.1 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. The limit is for the pair-produced vector-like b' using lepton-plus-jets final state. The search is also sensitive to the decays into Zb and Hb final states.
- ²² SIRUNYAN 18BM based on 35.9 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. The limit is for the pair-produced vector-like b'. Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming B(tW)=1, the limit is 1240 GeV and for B(bZ)=1 it is 960 GeV.
- ²³ SIRUNYAN 18Q based on 19.7 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. The limit is for the pair-produced vector-like b' that couple only to light quarks. Upper cross section limits on the single production of a b' and constraints for other decay channels (Zq and Hq) are also given in the paper.
- ²⁴ KHACHATRYAN 16AN based on 19.7 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. Limit on pair-produced vector-like b' using 1, 2, and >2 leptons as well as fully hadronic final states. Other limits depending on the branching fractions to tW, bZ, and bH are given in Table IX.

- ²⁵ AAD 15AR based on 20.3 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. Used lepton-plus-jets final state. See Fig. 24 for mass limits in the plane of B($b' \rightarrow Wt$) vs. B($b' \rightarrow Hb$) from $b'\overline{b}' \rightarrow Hb + X$ searches.
- 26 AAD 15 BY based on 20.3 fb $^{-1}$ of pp data at $\sqrt{s}=8$ TeV. Limit on pair-produced vector-like b' assuming the branching fractions to W,~Z,~ and h~ modes of the singlet model. Used events containing $\geq 2\ell + \not\!\! E_T + \geq 2j~(\,\geq 1~b)$ and including a same-sign lepton pair.
- ²⁷AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. Limit on pair-produced chiral b'-quark. Used events containing $\geq 2\ell + \not\!\!E_T + \geq 2j$ (≥ 1 b) and including a same-sign lepton pair.
- ²⁸ AAD 15CN based on 20.3 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. Limit on pair-production of chiral b'-quark. Used events with $\ell+E_T+\geq 4j$ (non-b-tagged). Limits on a heavy vector-like quark, which decays into Wq, Zq, hq, are presented in the plane $B(Q\to Wq)$ vs. $B(Q\to hq)$ in Fig. 12.
- ²⁹ Based on 20.3 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of b' in the events with dilepton from a high pT Z and additional jets (≥ 1 b-tag). If instead of B($b' \rightarrow Wt$) = 1 an electroweak singlet with B($b' \rightarrow Wt$) ~ 0.45 is assumed, the limit reduces to 685 GeV.
- 30 Based on 5.0 fb $^{-1}$ of pp data at $\sqrt{s}=7$ TeV. CHATRCHYAN 131 looked for events with one isolated electron or muon, large E_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
- ³¹ Based on 1.04 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a t quark in the events with a high p_T isolated lepton, large $\not\!\!E_T$, and at least 6 jets in which one, two or more dijets are from W.
- 32 Based on 2.0 fb $^{-1}$ of pp data at $\sqrt{s}=7$ TeV. No $b'\to Zb$ invariant mass peak is found in the search of heavy quark pair production that decay into Z and a b quark in events with $Z\to e^+e^-$ and at least one b-jet. The lower mass limit is 358 GeV for a vector-like singlet b' mixing solely with the third SM generation.
- 33 Based on 1.04 fb $^{-1}$ of pp data at $\sqrt{s}=7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large $\not\!\!E_T$, and ≥ 2 jets.
- $^{34}\, \rm Based$ on 1.04 $\rm fb^{-1}$ of $p\,p$ data at $\sqrt{s}=7$ TeV. AAD 12BE looked for events with two isolated like-sign leptons and at least 2 jets, large E_T and H $_T~>350$ GeV.
- 35 Based on 5 fb $^{-1}$ of pp data at $\sqrt{s}=7$ TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4'th generation quarks that decay to bW or tW. Absence of signal in events with one lepton, same-sign dileptons or trileptons gives the bound. With a mass difference of 25 GeV/c 2 between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about $\pm 20~{\rm GeV/c}^2$.
- 36 Based on 4.9 fb $^{-1}$ of $p\,p$ data at $\sqrt{s}=7$ TeV. CHATRCHYAN 12X looked for events with trileptons or same-sign dileptons and at least one b jet.
- 37 Based on 4.8 fb $^{-1}$ of data in $p\overline{p}$ collisions at 1.96 TeV. AALTONEN 11J looked for events with $\ell+E_T+\geq 5\mathrm{j}$ ($\geq 1~b$ or c). No signal is observed and the bound $\sigma(b'\overline{b}')$ < 30 fb for $m_{b'}>375$ GeV is found for B($b'\to Wt$) = 1.
- ³⁸ Based on 34 pb⁻¹ of data in pp collisions at 7 TeV. CHATRCHYAN 11L looked for multijet events with trileptons or same-sign dileptons. No excess above the SM background excludes $m_{b'}$ between 255 and 361 GeV at 95% CL for B($b' \rightarrow Wt$) = 1.
- ³⁹ Based on 2.7 fb⁻¹ of data in $p\overline{p}$ collisions at $\sqrt{s}=1.96$ TeV. AALTONEN 10H looked for pair production of heavy quarks which decay into tW^- or tW^+ , in events with same sign dileptons (e or μ), several jets and large missing E_T . The result is obtained for b' which decays into tW^- . For the charge 5/3 quark ($T_{5/3}$) which decays into tW^+ ,

- $m_{T_{5/3}} > 365$ GeV (95% CL) is found when it has the charge -1/3 partner B of the same mass.
- ⁴⁰ FLACCO 10 result is obtained from AALTONEN 10H result of $m_{b'} > 338$ GeV, by relaxing the condition B($b' \rightarrow Wt$) = 100% when $m_{b'} > m_{t'}$.
- ⁴¹ Result is based on 1.06 fb⁻¹ of data. No excess from the SM Z+jet events is found when Z decays into ee or $\mu\mu$. The $m_{b'}$ bound is found by comparing the resulting upper bound on $\sigma(b'\overline{b}')$ [1-(1-B($b' \to Zb$))²] and the LO estimate of the b' pair production cross section shown in Fig. 38 of the article.
- ⁴² HUANG 08 reexamined the b' mass lower bound of 268 GeV obtained in AALTONEN 07C that assumes $B(b' \to Zb) = 1$, which does not hold for $m_{b'} > 255$ GeV. The lower mass bound is given in the plane of $\sin^2(\theta_{t\,b'})$ and $m_{b'}$.
- ⁴³ AFFOLDER 00 looked for b' that decays in to b+Z. The signal searched for is bbZZ events where one Z decays into e^+e^- or $\mu^+\mu^-$ and the other Z decays hadronically. The bound assumes $B(b'\to Zb)=100\%$. Between 100 GeV and 199 GeV, the 95%CL upper bound on $\sigma(b'\to \overline{b'})\times B^2(b'\to Zb)$ is also given (see their Fig. 2).
- ⁴⁴ ABE 98N looked for $Z \to e^+e^-$ decays with displaced vertices. Quoted limit assumes B($b' \to Zb$)=1 and $c\tau_{b'}$ =1 cm. The limit is lower than m_Z+m_b (\sim 96 GeV) if $c\tau>$ 22 cm or $c\tau<$ 0.009 cm. See their Fig. 4.
- ⁴⁵ ABACHI 97D searched for b' that decays mainly via FCNC. They obtained 95%CL upper bounds on B($b'\overline{b}' \to \gamma + 3$ jets) and B($b'\overline{b}' \to 2\gamma + 2$ jets), which can be interpreted as the lower mass bound $m_{b'} > m_Z + m_b$.
- ⁴⁶ ABACHI 95F bound on the top-quark also applies to b' and t' quarks that decay predominantly into W. See FROGGATT 97.
- ⁴⁷ MUKHOPADHYAYA 93 analyze CDF dilepton data of ABE 92G in terms of a new quark decaying via flavor-changing neutral current. The above limit assumes B($b' \rightarrow b\ell^+\ell^-$)=1%. For an exotic quark decaying only via virtual Z [B($b\ell^+\ell^-$) = 3%], the limit is 85 GeV.
- ⁴⁸ ABE 92 dilepton analysis limit of >85 GeV at CL=95% also applies to b' quarks, as discussed in ABE 90B.
- 49 ABE 90B exclude the region 28–72 GeV.
- 50 AKESSON 90 searched for events having an electron with $p_T>12$ GeV, missing momentum > 15 GeV, and a jet with $E_T>10$ GeV, $\left|\eta\right|<2.2$, and excluded $m_{b'}$ _ between 30 and 69 GeV.
- ⁵¹ For the reduction of the limit due to non-charged-current decay modes, see Fig. 19 of ALBAJAR 90B.
- ⁵² ALBAJAR 88 study events at $E_{\rm cm}=546$ and 630 GeV with a muon or isolated electron, accompanied by one or more jets and find agreement with Monte Carlo predictions for the production of charm and bottom, without the need for a new quark. The lower mass limit is obtained by using a conservative estimate for the $b' \, \overline{b}'$ production cross section and by assuming that it cannot be produced in W decays. The value quoted here is revised using the full $O(\alpha_s^2)$ cross section of ALTARELLI 88.

b'(-1/3) mass limits from single production in $p\overline{p}$ and pp collisions

 1 TUMASYAN 220 based on 138 fb $^{-1}$ of data in pp collisions at 13 TeV. No significant excess over SM expectation is found in the search for a left-handed b' assuming 100% decay to tW using a t-tagged jet and a lepton from W. The model assumes that the b' has the excited quark couplings. The bound is from a statistical combination with an earlier analysis by SIRUNYAN 21AG. The 95% CL bounds are also set as 3.0, 3.0, and 3.2 TeV, respectively, for left-handed, right-handed, and vector-like couplings.

² ABAZOV 11F based on 5.4 fb⁻¹ of data in ppbar collisions at 1.96 TeV. ABAZOV 11F looked for single production of b' via the W or Z coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\overline{p} \rightarrow b'q \rightarrow Wuq$, and $p\overline{p} \rightarrow b'q \rightarrow Zdq$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.

³AAD 23CQ based on 139 fb⁻¹ of data in pp collisions at 13 TeV. No significant excess over SM expectation is found. Limits on mass and production cross section of a vector-like b' are obtained in several theoretical scenarios determined by the couplings betwen b' and W, Z, h.

⁴ SIRUNYAN 21AG based on 137 fb⁻¹ of data in pp collisions at 13 TeV. No significant excess over SM expectation is found in the search for a left-handed b' assuming 100% decay to tW using all hadronic final states, where t and W are tagged as single jets, respectively. The model assumes that the b' has the excited quark couplings. The 95% CL bounds are also set as 2.8 and 3.1 TeV, respectively, for the right-handed and vector-like couplings.

⁵ SIRUNYAN 19AI based on 35.9 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the b'(-1/3)+b and b'(-1/3)+t modes as a function of the vector-like quark mass in Figs. 7 and 8 and in Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

 6 AAD 16AH based on 20.3 fb $^{-1}$ of data in pp collisions at 8 TeV. No significant excess over SM expectation is found in the search for a vector-like b' in the single-lepton and dilepton channels (ℓ or $\ell\ell$) + 1,2,3 j (\geq 1b). The model assumes that the b' has the excited quark couplings.

⁷ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on left-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.

⁸ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on right-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.

⁹ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on vector-like b' assuming 100% decay to tW and using all-hadronic, lepton+jets, and dilepton final states.

MASS LIMITS for b' (4th Generation) Quark or Hadron in e^+e^- Collisions

Search for hadrons containing a fourth-generation -1/3 quark denoted b'.

The last column specifies the assumption for the decay mode (CC denotes the conventional charged-current decay) and the event signature which is looked for.

 $^{^1}$ DECAMP 90F looked for isolated charged particles, for isolated photons, and for four-jet final states. The modes $b'\to bg$ for B($b'\to bg$) >65% $b'\to b\gamma$ for B($b'\to b\gamma$) >5% are excluded. Charged Higgs decay were not discussed. 2 ABDALLAH 07 searched for b' pair production at $E_{\rm cm}=196$ –209 GeV, with 420 pb $^{-1}$.

² ABDALLAH 07 searched for b' pair production at $E_{\rm cm} = 196$ –209 GeV, with 420 pb⁻¹. No signal leads to the 95% CL upper limits on B($b' \to bZ$) and B($b' \to cW$) for $m_{b'} = 96$ to 103 GeV.

³ ADRIANI 93G search for vector quarkonium states near Z and give limit on quarkonium- Z mixing parameter $\delta m^2 < (10-30) \text{ GeV}^2$ (95%CL) for the mass 88–94.5 GeV. Using Richardson potential, a 1S $(b'\overline{b}')$ state is excluded for the mass range 87.7–94.7 GeV. This range depends on the potential choice.

 $^{^4}$ ABREU 90D assumed $m_{H^-} < m_{b'} - 3$ GeV.

- ⁵Superseded by ABREU 91F.
- 6 AKRAWY 90B search was restricted to data near the Z peak at $E_{\rm cm}=91.26$ GeV at LEP. The excluded region is between 23.6 and 41.4 GeV if no H^+ decays exist. For charged Higgs decays the excluded regions are between ($m_{H^+}+1.5$ GeV) and 45.5 GeV.
- GeV. ⁷ AKRAWY 90J search for isolated photons in hadronic Z decay and derive $B(Z\to b'\overline{b'})\cdot B(b'\to \gamma X)/B(Z\to \text{ hadrons}) < 2.2\times 10^{-3}. \text{ Mass limit assumes} \\ B(b'\to \gamma X)>10\%.$
- $^8 \, {\rm ABE}$ 89E search at $E_{\rm cm}=56\text{--}57$ GeV at TRISTAN for multihadron events with a spherical shape (using thrust and acoplanarity) or containing isolated leptons.
- $^9\,\mathrm{ABE}$ 89G search was at $E_\mathrm{cm}=$ 55–60.8 GeV at TRISTAN.
- ¹⁰ If the photonic decay mode is large (B($b' \rightarrow b\gamma$) > 25%), the ABRAMS 89C limit is 45.4 GeV. The limit for for Higgs decay ($b' \rightarrow cH^-$, $H^- \rightarrow \overline{c}s$) is 45.2 GeV.
- 11 ADACHI 89C search was at $E_{\rm cm}=56.5$ –60.8 GeV at TRISTAN using multi-hadron events accompanying muons.
- 12 ADACHI 89C also gives limits for any mixture of $\it CC$ and $\it bg$ decays.
- 13 ENO 89 search at $E_{\rm cm}=$ 50–60.8 at TRISTAN.
- 14 ENO 89 considers arbitrary mixture of the charged current, bg, and $b\gamma$ decays.
- ¹⁵ IGARASHI 88 searches for leptons in low-thrust events and gives $\Delta R(b') < 0.26$ (95% CL) assuming charged current decay, which translates to $m_{b'} > 24.4$ GeV.
- 16 SAGAWA 88 set limit $\sigma(\text{top}) < 6.1$ pb at CL=95% for top-flavored hadron production from event shape analyses at $E_{\text{cm}} = 52$ GeV. By using the quark parton model cross-section formula near threshold, the above limit leads to lower mass bounds of 23.8 GeV for charge -1/3 quarks.
- 17 ADEVA 86 give 95%CL upper bound on an excess of the normalized cross section, $\Delta R_{\rm s}$ as a function of the minimum c.m. energy (see their figure 3). Production of a pair of $^{1/3}$ charge quarks is excluded up to $E_{\rm cm}=45.4$ GeV.
- 18 ALTHOFF 84C narrow state search sets limit $\Gamma(e^+e^-)$ B(hadrons) <2.4 keV CL = 95% and heavy charge 1/3 quark pair production m >21 GeV, CL = 95%.
- 19 ALTHOFF 84I exclude heavy quark pair production for 7 < m <19 GeV (1/3 charge) using aplanarity distributions (CL = 95%).
